## U.S. CENSUS OF AGRICULTURE : 1959

Final Report-Vol. 1-Part 28-Counties

FARMS • FARM CHARACTERISTICS
LIVESTOCK and PRODUCTS
CROPS • FRUITS•VALUES

## Georgia

## COUNTIES

Prepared under the supervision of RAY HURLEY, Chief
Agriculture Division

U.S. DEPARTMENT OF COMMERCE Luther H. Hodges, Secretary
bureau of the census
Richard M. Scommon, Director (From May 1, 1961 ) Robert W. Burgess, Director (To March 3, 1961 )

# BUREAU OF THE CENSUS 

RICHARD M. SCAMMON, Director

A. Ross Eckler, Deputy Director

Howard C. Grieves, Assistimt Director
Conrad Taeuber, Assistam Director
Lowell T. Galt, Special Assistant
Herman P. Miller, Special Assistant
Morris H. Hansen, Assistall Director for Statistical Standards
Julius Shiskin, Cbief Economic Statistician
Joseph F. Daly; Chief Mathematical Statistician
Charles B. Lawrence, Jr., Aisistant Director for Operations
Walter L. Kehres, Assistant Director for Administration
Calvert L. Dedrick, Cbief International Statistical Programs Office
A. W. von Struve, Acting Public Information Officer

Agriculture Division-
Ray Hurley, Chuef
Warder B. Jenkins, Assistant Chief
Orvin L. Wilhite, Assistant Cbref
Field Division-
Jefferson D. McPike, Chief
Ivan G. Munro, Assistant Chief
Machine Tabulation Division-
C. F. Van Aken, Chief

Henry A. Bloom, Assistant Chief
Administrative Service Division-Everett H. Burke, Chief
Budget and Management Division-Charles H. Alexander, Chief
Business Division-Harvey Kailin, Cbief
Construction Statistics Division-Samuel J. Dennis, Chief
Decennial Operations Division-Glen S. Taylor, Chief
Demographic Surveys Division-Robert B. Pearl, Cbief
Economic Operations Division-Marion D. Bingham, Chief
Electronic Systems Division-Robert F. Drury, Chief
Foreign Trade Division-J. Edward Ely, Chief
Geography Division-William T. Fay, Chief

Governments Division-Allen D. Manvel, Chief
Housing Division-Wayne F. Daugherty, Chief
Industry Division-Maxwell R. Conklin, Chief
Personnel Division-James P. Taff, Chief
Population Division--Howard G. Brunsman, Chief
boston public lierary
Statistical Methods Division-Joseph Steinberg, Chief
Statistical Reports Division-Edwin D. Goldfield, Chief
Statistical Research Division-William N. Hurwitz, Chief
Transportation Division-Donald E. Church, Chief

Statistics in this report supersede figures shown in Series AC59-1 and AC59-2, Preliminary Reports

Library of Congress Catalog Card Number: A60-9482

## SUGGESTED CITATION

U.S. Bureau of the Census. U.S. Census of Agriculture: 1959. Vol. 1, Counties, Part 28 Georgia
U.S. Government Printing Office, Washington, D.C., 1961

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington 25, D.C., or any of the Field Offices of the Department of Commerce. Price $\$ 2.00$

## PREFACE

Volume I, Counties, is one of the five principal reports presenting the results of the 1959 Census of Agriculture. This volume, in 54 parts, presents the compilation of the information given by farm operators to census enumerators in 1959.

The 1959 Census of Agriculture was taken in conformity with the Act of Congress of August 31, 1954 (amended August 1957), which codified Title 13, United States Code.

The collection of the data was carried out by census enumerators directed by supervisors appointed by the Director of the Bureau of the Census and working under the direction of Robert B. Voight, then Chief, Field Division. Paul R. Squires, then Special Assistant to the Director, was responsible for the recruitment of the field staff. The planning of the census and the compilation of the statistics were supervised by Ray Hurley, Chief, Agriculture Division, Warder B. Jenkins, Assistant Chief, and Orvin L. Wilhite, Assistant Chief. They were assisted by M. Vincent Lindquist, Thomas Jabine, Robert S. NcCauley, John C. Mackey, Robert Standley, IIilton E. Robison, Helen E. Teir, Carl R. Nyman, Kenneth R. Norell, Gladys L. Eagle, Henry I. DeGraff, Charles H. Boehne, Joseph A. Correll, Margaret G. Wood, Evelyn K. Jett, Simon Yablon, Emma B. Gass, Charlotte I. Messinese, Bennie L. Sharp, Isaac E. Lemon, James M. Lindsey, Samuel S. Murray, William F. Kauffman, Hector Vila, Harry P. Owings, Charles A. Nicholls, Henry A. Tucker, Robert S. Boyle, Helen MI. Davenport, Albert W゙. Graybill, Lois G. Miller, Thomas D. Monroe, Gerald P. Owens, Beruard L. Ross, Marvin M. Thompson, Helen D. Turner, Kurt W. Luethy, Arnold L. Bollenbacher, George W. Coffman, Joseph A. Horak, Samuel J. Hundley, Donald K. Larson, Chester G. Lykins, Wihmer R. Maxham, Virgil L. McClain, Jr., Darrell D. Prochaska, Robert J. Rades, Hubert E. Sites, Duane E. Traylor, Donald H. von Steen, Elmer O. Rea, Frances G. Compton, Lillian W. Bentel, and Neil V. Perkins.

Acknowledgment is made of the technical assistance and the loan of personnel by the United States Department of Agriculture in the planning, the enumeration, and the compilation of the 1959 Census of Agriculture.

# UNITED STATES CENSUS OF AGRICULTURE: 1959 <br> FINAL REPORTS 

Volume I-Counties-A separate part for each State. Statisties on mumber of farms; farm characteristies; acreage in farms; cropland and other uses of land; land-use practices; irrigation; farm facilities and equipment; farm labor; farm expenditures; use of commercial fertilizer; number and kind of livestock; acres and production of crops; vatur of farm products; eharacteristics of commerciat farms, farms classified by tenure, by size, type, and economic class; and comparative data from the 1954 Census of Agriculture.

Volume I is published in 54 parts as follows:

| Part | State or States | Part | State or States | Part | State or States |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | New England States: |  | West North Central-Continued |  | Mountain: |
| 1 | Maine. | 19 | South Dakota. | 38 | Montana. |
| 2 | New Hampshire. | 20 | Nebraska. | 39 | Idaho. |
| 3 | Vermont. | 21 | Kiansas. | 40 | Wyoming. |
| 4 | Massachusetts. |  | South Atlantic: | 41 | Colorado. |
| 5 | Rhode Island. | 22 | Delaware. | 12 | New Mexico. |
| 6 | Connecticut. | 23 | Maryland. | 43 | Arizona. |
|  | Middle Atlantic States: | 24 | Virginia. | 44 | Utah. |
| 7 | New York. | 25 | West Virginia. | 45 | Nevada. |
| 8 | New Jersey: | 26 | North Carolina. |  | Pacific: |
| 9 | Pennsylvania. | 27 | South Carolina. | 46 | Washington. |
|  | East North Central: | 28 | Georgia. | 47 | Oregon. |
| 10 | Ohio. | 29 | Florida. | 48 | Catifornia. |
| 11 | Indiana. |  | East South Central: | 49 | Alaska. |
| 12 13 | Jllinois. Michigan. | 30 | Kentucky. | 50 | Hawaii, |
| 13 | Michigan. | 31 | Tennessee. |  | Other Areas: |
| 14 | $\xrightarrow{\text { Wisconsin. }}$ | 32 | Alabama. | 51 | American Samoa. |
|  | West North Central: | 33 | $\xrightarrow[\text { Mississippi. }]{\text { West South Central }}$ | 52 | Guam. |
| 15 16 | Minnesota. Iowa. | 34 | West South Central: Arkansas. | 53 54 | Puerto Rico. <br> Virgin Islands. |
| 17 | Missouri. | 35 | Louisiana. | 54 | Virgin Istands. |
| 18 | North Dakota. | 36 37 | Oklahoma. Texas. |  |  |

Volume II-General Report.-Statistics by Subjects, United States Census of Agriculture, 1959. Summary data and analyses of the data by States, for geographic divisions, and for the United States, by subjects, as illustrated by the chapter titles listed below:

| Chapter | Title | Chapter | Title |
| :---: | :---: | :---: | :---: |
| 1 | Farms and Land in Farms. | VII | Field Crops and Vegetables. |
| 11 | Age, Residence, Years on Farm, Work Off Farm. | VIli | Fruits and Nuts, IIorticultural Specialties, Forest Prod- |
| 111 | Farm Facilities, Farm Equipment. |  | nets. |
| IV | Farm Labor, Use of Fertilizer, Farm Expenditures, and Cash Rent | IX | Value of Farm Products. <br> Color Pace and Truure of Farm Operator |
| V | Size of Farm. | X | Color, Race, and Tenure of Farm Operator. Economic Class of Farm. |
| VI | Livestock and Livestock Products. | XII | Type of Farm. |

Volume III-Irrigation of Agricultural Lands. Western States (Dry Areas) - Data by States for drainage basins and a summary for the area, including number and types of irrigation organizations, source of water, expenditures for works and equipuent since 1950, water used and aeres served for irrigation purposes.

Volume IV—Drainage of Agricultural Lands. Data by States on land in drainage organizations, number and types of organizations, cost of drainage and drainage works.

Volume V—Special Reports, Part 1.-Horticultural Specialties. Statistics by States and a summary for the United States presenting number and kinds of operations; gross receipts and/or gross sales; sales of nursery products, flower seel, vegetables grown under glass, and propagated mushrooms; number of containergrown plants; inventory products; sales of bulb crops; employment; structures and equipment.

Titles of additional parts of this volume are not avaitable as this report goes to press.

## INTRODUCTION

## THE 1959 CENSUS OF AGRICULTURE

History of the Census.-The 1959 Census is the 17 th nationwide agricultural census. The first agrlcultural census was taken in 1840, at the same fime as the Sixth Decennial Census of Population. From 1850 to 1920 , an agricultural census was taken evers 10 years. With increased application of scientific findings and the growing use of mechanization in agriculture, farming practices were changing so rapidly that facts collected at 10 -Tear intervals were no longer adequate. Aware of the need for more accurate and timely information, the Congress in 1909 (36 stat. 10, sec. 31, provided for a census to be taken in 1915 and every 10 years thereafter which was to be in addition to the census of agriculture to be taken at the time of the decennial census of population. The 1915 census was not taken, bowever, because of the abnormal conditions created by World War 1. Peginning with 1920 , a national agricultural census has been taken every 5 years.

Legal Basis for the Census.-The 1959 Census of Agriculture was authorized by an Act of Congress, as were all prior censuses of agriculture. "Title 13, United States Code-Census," codified in August 1954, and amended in August 1957 and September 1960, is now the legal basis for censuses of agriculture and other censuses, and survers conducted br the Rureau of the Census. Section 142, paragrapll (a), of Title 13 makes provision for the Census of Agriculture. It reads as follows:

[^0]bers of the Washington and Regional Offices of the Bureau and of the U.S. Department of Agriculture trained approximately 110 agriculture field assistants and 2,100 crew leaders. The crew leaders, in turn, trained and supervised aplrmximately 30,000 enumerators. All training was presented according to procedures contained in various guides and manuals prepared by the Bureau. The training program included filmstrips, map-reading, practice interviewing, and practice filling of questionnaires and other census forms. In most instances, training sessions were held near the areas in which employees worked and immediately prior to the beginning of their assignments.

Enumeration Period.-The actual enumeration in the conterminous United States (see page XIV) started at dates varying from October 7 to November 18, 1959. In general, starting dates were based upon regional variations ln harresting seasons and on weather conditions. The primary aim was to have the enumeration late enough to follow the harvesting of the bulk of important crops and early enough to precede the advent of winter weather with the attending unfavorable travel conditions. The bulk of the enumeration work was completed within three to four weeks after the starting date. In IIaraii, the enumeration was made during the months of December 1959 and January 1960 ; and in Alaska, during April 1960.

Enumeration starting dates for the censuses of 1959 and 1954 are given in State table 11, together with figures showing the percentage of farms enumerated in the State during weekly periods. The average enumeration date for the 1959 census for each county is given in county table 6 .

Data for inventors items-land in farms, machinery and equipment, lirestock, and poultry-relate to the situation at the actual time of enumeration of each individual farm. Data for acres, production, and sales of crops relate generally to the crops harvested during the crop sear 1959 , regardless of whether and when they were sold while data for sales of livestock and livestock products relate to the calendar sear 1959. Since the enumeration was made before the end of 1959 , special emplasis was placed upon the inclusion of estimates for crops yet to be sold and for livestock and livestock products experted to be sold in the period from the time of enumeration to the end of the calendar sear. Instructions on the questionnaire and the wording of questions were designed to assure that full crop-sear or calendar-year data would be reported. For example, "How much of this year's crop was or will be sold?"

## ENUMERATION FORMS AND PROCEDURES

Authorization.-Section 5 of Title 13 of the United States Code authorizes the preparation of forms and questionnaires used in the census. It reads as follows:
"The Secretary shall prepare schedules, and shall determine the inquiries, and the number, form, and subdivisions thereof, for the statistics, survegs, and censuses provided for in this title."
The Agriculture Questionnaire.-The questionnaire for the 1959 Census of Agriculture was prepared by the staff of the Bureau. Selection of the inquiries was based on the results of the 1958 pretest aud experience gained in earlier censuses. Careful consideration was given to such factors as the current availability
of data from other sources, the possibitity of obtaining data by methods other than a census, the adequacy of the data that might be obtained, and the need for and usefulness of the data. Two committees gave adrice and counsel to the Burcau. One of these, a Special Advisory Committee, was composed of members designated by the organizations they represented, fotlowing an invitation from the Director of the Bureau of the Census to name a representative to serve in an advisory capacity. The Special Advisory Committee for the 1959 Census of Agricutture was made up of one representative from each of the foltowing: Agricuttural Publishers Association, American Association of LandGrant Colleges and State Universities, American Farm Bureau Federation, American Farm Economic Association, American Statistical Association, Farm Equipment Institnte, National Association of Commissioners, Secretaries, and Directors of Agricutture, National Councit of Farmer Cooperatives, National Farmers' Union, National Grange, Rurat Sociological Society, and the U.S. Department of Agriculture. A representative of the Bureau of the Budget was in attendance at all meetings of the Advisory Committee.

Because of the special interest of the U.S. Department of Agriculture in censuses of agriculture, the Director of the Bureau of the Census songht the continuous cooperation of that organization in devetoping plans, questionnaires, and procedures for the 1959 Census of Agriculture. Working Groups were established in the U.S. Department of Agriculture to make recommendations for the following general subjects:

```
Tenure, Land Values, and Mortgage Debt
Land Use and Conservation and Production Practices
Field Crops
Fruits and Vegetables
Forest l'roducts
Livestock, Poultry, and Dairy
Income and Expenditure (including Contractual Operations)
Farm Labor
Equipment and Facitities (including Structures)
```

Each Working Group had the responsibility for ascertaining the U.S. Department of Agriculture's need for data in the fietd covered by its "terms of reference" and for presenting recommendations to a smatl Joint Committee comprising representatives of both the Bureau of the Census and the U.S. Department of Agriculture. The Joint Committee received written recommendations from each Working Group. The Chairman of each Group appeared before the Joint Committee as did any member of the Working Groun who was needed to present supplemental information of a specialized nature.

Prior to the formulation of the questionnaire, State Agricultural Colleges and other major users of census data were invited to suggest inquiries for the enumeration. Each member of the Speciat Advisory Committee had the opportunity and the responsibility for channeting in suggestions from the organization be represented. The number of inquiries submitted from atl sources greatly exceeded the number that could be included in the census, from the point of view of cost, of the respondent's time and patience, and of practicat vatue to the majority of users of data.

The final selection included 316 questions, some of which consisted of several parts, for the 48 States comprising the conterminons United States. Atthough each of the 316 questions was asked in one or more of the 48 States, considerably tess than this totilt was asked in any one State because of the use of "State" questionnaires. Noreover, about 50 questions out of the total were asked of approximately one-fifth of all farm operators in the State. The number of questions ranged from 159 on the questionnaire for Maine to 194 on the questionnaire for California. In all, 38 fersions of the questionnaire-one for each State or combination of adjoining States and two for Texas-
were used for the 1959 census in the conterminous United States as compared with 21 rersions in 1954 and 41 in 1950 . A separate rersion was used in Alaska and auother in Hawaii.

Differences in the questionnaires were designed to account for regional and local differences in agriculture. Most, but not all, of the differences related to crops. The use of State questionnaires made possibte the inclusion of separate inquiries for all important crops grown within a State and, at the same time, a reduction in the total number of inquiries for a State. Questions that did not apply, to any considerable degree, to a particutar State were omitted from the questionnaire used in that State. For example, separate questions about citrus fruits were omitted from alt questionnailes except for the few States where citrus fruits are grown. An added advantage of State questionnaires was that production and sales data could be asked in the unit of measure most commonly used by the farmers in each State. Regional variation in the number and type of questions is an important provision of the census for obtaining complete coverage of agricultural operations.

About 2 weeks before the start of the enumeration, agriculture questionnaires were mailed to most bouseholds in rural areas. A letter was attached to each questionnaire asking the farm operator to fill the questionnaire and to give it to the enumerator when he called. The purpose of this procedure was to save time and money in taking the census and to improve the quality of the information given by farm operators. By having the questionnaire ahead of time, the farmer could determine what information wonld be required and could check his records in adrance of the enumerator's visit. It was, however, the responsibitity of the enumerator to obtain an agriculture questionnaire for each place which qualified. If the questionnaire had been filled ont by the farm operator, the enumerator was instructed to examine the questionnaire for completeness and accuracy and, if need be, to give the farmer such help as might be necessary.

Agricultural Operations.-The training of enumerators stressed the concept that a census of agriculture is a census of agricultural operations rather than a census of farms. This concept was intended to assure a complete agricultural census free of any personal judgment by enumerators as to what constitutes a farm. In accordance with clearly defined procedures, an enumerator was required to obtain an agriculture questionnaire for each person who had charge of one or more agricultural operations, whetner or not he considered himself to be a farm operator. For enumeration purposes, it was considered that there were agricultural operations on a place if, at any time in 1959-
a. Any livestock (hogs, cattle, sheep, goats, horses, or mules) were kept on the place.
b. A combined totat of 20 or more chickens, turkeys, and ducks were kept on the ptace.
c. Any grain, hay, tobacco, or other field crops were grown on the place.
d. A combined total of 20 or more fruit trees, grapevines, and nut trees were on the place.
e. Any vegetabtes, berries, or nursery or greenhouse products were grown on the place for sate.
As a result of the requirement that all places having agriculturat operations be enumerated, more questionnaires were obtained than are inctuded in the tabulations for firms. During the office processing operations that foltowed the completion of enumeration, criteria were applied to the questionnaires to sort out for tabulation those that represented farms according to the census definition of a farm (see page XIV).

Enumeration Assignments and Enumeration Districts.-To as sure a complete enumeration within the time allotted, the United States (exeluding Alaska and Hawaii) was divided into 29,374 Enumeration Assignments, or EA's. Each EA comprised an
area that one enumerator could reasonably be expected to canvass within a 3 - to 4 -week period, as indicated by performance records from the 1954 census.

Each EA was made up of one or more Enumeration Districts, or "ED's," as the geographic unit for enumeration. Prior to the enumeration, the ED's were ciassified into three groups on the basis of the density of dwellings in relation to the number of farms, as indicated by the 1954 Census of Agriculture, the 1950 Census of I'opulation and Housing, current population estimates, and highway maps showing culture which were basic to establishing the boundaries of each asslgnment. Through the use of different canvassing procedures for each group of ED's, the Bureau was able to reduce the cost of enumeration without running any material risk of missing any farms or other places with agricultural operations. The ED groupings and canvassing procedures are described below.

Group I Enumeration Districts.-In general, ED's with no well-defined cluster of dwellings were considered to be opencountry areas and comprise Group I. For each ED of Group I, in his Enumeration Assignment, the enumerator was required to list in his Record Book the name of every head of household living in the ED and also the name of every person not llving in the ED who had agricultural operations there. There were approximately 20.751 ED's in Group I for the 1959 Census.
Group II Enumeration Districts.-Rural ED's in which the number of dwellings was large in relation to the number of farms were considered to be in Group 11. For each ED, in Group II, the enumerator was required to list the head of the household for all dwellings in the ED except for those on less than one acre of ground in built-up residential areas of 50 or more dwellings. He was also required to determine, by observation or local inquiry, whether there were any farms or other places with agricultural operations in the built-up areas and, if so, to obtain an agriculture questionnaire. There were approximately 7,979 ED's in Group 11.

Group III Enumeration Dlstricts.-Most incorporated places and unincorporated villages having approximately 150 or more dwellings were designated as separate ED's and are classified as Group III. Also, most ED's in counties around large metropolitan areas were designated as Group III Ed's. Prior to the 1959 Census of Agriculture, places enumerated in these areas during the 1954 Census of Agriculture were listed in the Enumerator's Record Book. The enumerator was required to visit and emmerate or otherwise account for each place listed in his Record Book. In addition, he was instructed to ask at each of these ptaces if there were any farms or other places with agricultural operations in the Enumeration District, and, if so, to add them to his list and enumerate them. There were approximately 15,836 Group 111 ED's in 1959. According to the 1954 Census, these ED's contained 380,575 farms.
A few enumeration districts that comprised incorporated places or that were within an incorporated city were classified as Group I or Group II because they had a large number of farms. A few others, comprising extensive rural districts requiring considerable travel, were classified as Group III because they had only a small number of farms.

Enumerator's Record Book.-Each enumerator received one or more Record Books containing a listing form for use during canvassing. (See appendix for facsimile of one page of listing form included in Enumerator's Record Book.) The lines on the listing form were numbered in consecutive order. Except as otherwise prescribed for Group II and Group III ED's, the enumerator listed in his Record Book the name of each head of household living in his assigned area and also the name of each person not living in his area who had agricultural operations there. As be made his listing, he also asked the questions about agricultural operations that were printed on the listing form. Answers to these questions determined, for the enumerator, whether or not an agriculture questionnaire was required for the person listed and, if so, whether he or some other enumerator was responsible for getting it. Thus, the Record Book served as an important aid to the enumerator in securing complete coverage of all agricultural operations within his area. At the same
time, it helped to prevent enumeration of the same place by two or more enumerators.

Enumeration Maps.-As a second ald to getting complete coverage, each enumerator recelved a map or, in a few exceptional cases, a brief written description of the area assigned to him for enumeration. He was required to plan and follow an orderly route of enumeration within the boundaries of his assigned area in accordance with established canvassing procedures. As the enumerator listed a place in his Record Book, he indicated its location by copying onto his map the number of the line on which he listed it. This numbering system indicated the enumerator's route of travel, and helped both the enumerator and his crew leader to determine the extent of coverage of the enumerator's assignment at any given time.
Lists of Special and Large Farms.-Prior to the enumeration, a card list of "special and large farms" was prepared on the basis of records obtained from the 1954 census and from Federal and State agricultural agencies. In general, "special and large farms" fell into one of three categorles: (1) farms having unusually large acreages, livestock inventorles, or annual sales as iudicated by available records; (2) farms known to be specializing In such operations as broiler production, turkey growing, feed lots, nursery or greenhouse production, cranberry bogs, citrus groves, etc.; (3) farms that might easily be overlooked because they had absentee operators or were not locally thought of as farms, such as institutions, Indian reservations, grazing associations, ete.
Enumerators were given the cards for the special and large farms within their assigmment areas to use as aids to obtaining complete coverage. Generally, the cards provided insurance against the omission of farming units that could have a slgnificant effect on the totals for a glven county or State. The enumerator was instructed to obtain an agriculture questionnaire for each special or large farm in his area or to write an explanation on the card as to why an agriculture questionnaire was not required on the basis of 1959 operations. The crew leader bad a duplicate set of cards for use in checking enumeration coverage.
Landlord-Tenant Questionnaire.-As in several previous censuses, a special landlord-tenant questlonnaire was used in some parts of the South as a supplement to the agriculture questionnaire. lts purpose was to help the enumerator get complete and accurate coverage of individually operated tracts of land that were actually part of one operating unit under the control of one landlord. To accomplish this purpose, the enumerator was required to fill a landlord-tenant questionnaire for each landlord who had any land worked on shares. The entries made in this questlonnaire included the name of each sharecropper, tenant, or renter ; the amount of land assigned to each; and the acreage and quantity of crops harvested on shares. By checking these entries against the agriculture questionnaires obtained for the individual operators, the enumerator and the Central Office could verify that each part of the operating unit controlled by the landlord was enumerated and that it was enumerated only once. The landlordtenant questionnaire was used in 386 counties in the 1959 census as compared with approximately 900 counties $\ln 1954$.

Township Sketch Map.-In some areas of the Great Plains, a considerable portion of land is farmed by nonresident operatorsthat is, by persons who do not live on the land they operate or who live on it only during part of the year. Enumerators in these areas used a spectal mapping form, the Township Sketch, in additlon to their enumeration maps as an aid to obtaining complete coverage. Each township included on the sketch was identified by township and range number and was divided into 144 small squares. In a standard section of 640 acres, each square represented a quarter section of land, or 160 acres. As the enumerator canvassed his assignment area, he indicated the acreage and location of each farm, ranch, and tract of nonfarm
land by drawing its boundaries on the sketch. He also used a simple numbering system as a cross reference between the agricultural land identified on the sketch and the questionnaire on which it was reported. The Township Sketch was used in all counties of North Dakota and South Dakota and ln selected counties of Colorado, Kansas, Minnesota, Montana, Nebraska, New Mexico, Oklahoma, and W soming.

Field Review of Enumerator's Work.-In the 1959 census, greater emphasis was placed on a detailed review of enumerators' work during enumeration than had been the case in previous censuses. The objective was to detect and correct enumeration errors as early as possible in order to achieve and maintain a high quality of individual performance. Starting on the first day of enumeration and continuing througlout the enumeration period, cach crew leader was instructed to make regular and frequent risits to his enumerators. At each risit, he was to follow a clearly defined procedure for observing the enumerator's conduct of interviews and for checking his listings, maps, questionnaires, and other forms for accuracy and completeness.

As an aid to checking coverage and enumerator efficiency, the crew leader was given a list containing estimates, based on the 1954 census, of the number of questionnaires required in each enumeration assignment area within his district, and of the mileage and time required to obtain those questionnaires.

## SAMPLING

Use of Sampling.-In the 1959 census, as in several previous censuses, sampling was used in two ways: for enumeration and for tabulation. Sampling in enumeration consisted of the collection of information about the items included in sections IX through $X V$ of the questionnaire for only a sample of farms. The "sample" items relate to sales of dairy products and sales of livestock, use of fertilizer and lime, farm expenditures, land-use practices, farm labor, equipment and facilities, rental agreements, farm values, and farm mortgage debt. The same sample of farms was used for tabulations by type of farm and by economic clase of farm and for many of those by size of farm and by color and tenure of operator.

Description of the Sample.-The sample used for the 1959 Census of Agriculture consisted of all farms with a total area of 1,000 or more acres or with estimated sales of $\$ 100,000$ or more in 1959 , and approximately 20 percent of all other farms. Farms with 1,000 or more acres were universally included in the sample during enumeration. As the enumerator filled the questionnaire, he determined the number of "acres in this place" (see question 7 of the agriculture questionnaire). If the acreage amounted to 1,000 or more he was required to fill sections $I X$ through $X V$ of the questionnaire. Farms with less than 1,000 acres, with estimated sales of $\$ 100,000$ or more, were included in the sample during the office processing. For these farms the information for sections IX through XV was obtained by mail.

The selection of farms of less than 1,000 acres for incluslon in the sample was made during enumeration, according to the following procedure: As the enumerator determined that he was required to obtain a questionnaire, he assigned a number to it, whether or not he was able to obtain the questlonnaire on his first visit. He assigned numbers in consecutive order, beginning with " 1 " for the first questionnaire required In each enumeration district within his area. He was instructed to fill sections IX throngh $X V$ on all questionnaires for which the assigned number ended in " 2 " or " 7 " (i.e. $2,7,12,17,22$, etc.).

Adjustment of the Sample.-An adjustment in the part of the sample that was comprised of farms of less than 1,000 acres and With estimated sales of less than $\$ 100,000$ was made by a process essentially equivalent to stratifying the farms in the sample by
size of farm. The purpose of this adjustment was to Improve the reliability of the estimates based on the sample and to reduce the effects of possible biases introduced by enumerators who deriated from the prescribed procedure for selecting the sample farms. The adjustment procedure was carried out for "blocks" of counties, each consisting of from one to ten counties in a State. To adjust the sample, separate counts were made for each county, and for the block of counties of all farms and of farms in the sample for each of 10 size-of-farm groups based on the "acres in this place" (question 7). The 10 slze-of-farm groups were as follows: under 10 acres, 10 to 49 acres, 50 to 69 acres, 70 to 99 acres, 100 to 139 acres, 140 to 179 acres, 180 to 219 acres, 220 to 259 acres, 260 to 499 acres, and 500 to 999 acres. Farms of less than 1,000 acres, but with value of sales of $\$ 100,000$ or more, were excluded from these counts. For each size-of-farm group, the number of farms in the sample for the block of counties was adjusted to make it equal or approximately equal to the total number of farms divided by five. Thls was accompiished for each group by the elimination or duplication on a random basis, of farms in those counties where the difference between the actuai proportion in the sample and the expected 20 percent was in the same direction as the difference for the block of counties.

Estimation of Totals for the Sample.-For the ltems Included in the sample part of the questionnaire (sections IX through XV), estimated totals for all farms were derived from the tabulated totals for the farms in the adjusted sample. First, Item-byItem totals, as tabulated for that part of the sample comprising farms of less than 1,000 acres and with estimated sales of less than $\$ 100,000$, were multiplied by 5. These estimated item-byitem totals were then added to the corresponding item totals, as tabulated, for all farms of 1,000 acres and over and farms with estimated sales of $\$ 100,000$ and over. The resulting values represent the estimated totals for all farms.

Presentation of Sample Data,--In tables where a small amount of data based on the sample farms is presented together with data for all farms, the data based on the sample are printed in italics. Other tables contaln headnotes explaining that most of the data are estimates based on reports for only a sample of farms.

Reliability of Estimates.-The estimated totals for all farms of the items enumerated for only the sample farms are subject to sampling errors. The estimated totals obtained by making tabulations for only the farms included in the sample are also subject to sampling errors. State tables 23 and 24 contain approximate measures of the sampllng reliability of the estimates for numbers of farms reporting and for ltem totals. While these measures indicate the general level of sampling reliability of the estimates, they do not completely reflect errors arising from sources other than sampling; for example, errors in the original data reported by farmers. Errors arising from sources other than sampling may, in some instances, be relatively more important than sampllng rariation, especially for county totals.

The general level of sampling reliability of estimated totala may be determined from the data in State tables 23 and 24 . State table 24 contains a list of items, together with a flgure for each item indicating one of the four levels of sampling reliability that are presented in State table 23. For each item the sampling error according to the number of farms reporting may be determined from State table 23 , in the column for the level of sampling reliahillty deslgnated in State table 24. To determine the sampling reliability for any item, reference must be made to State table 24 to find out which of the four levels of sampling reliability given in State table 23 should be used, and also the appropriate county or State table to obtain the number of farms reporting the item.

As explained in State table 23, the level of sampling reliability designated as level 1 should always be used to determine the sampling reliability of estimated numbers of farms or of farms reporting.

State table $\mathbf{2 3}$ shows percentage limits such that chances are about 68 out of 100 that the difference between an estimate based on the sample and the figure that would have been obtained from a tabulation of all farms would be no more than the percentage specified for the estimated number of farms reporting that item. The chances are about 99 out of 100 that the differeuce would be less than $21 / 2$ times the percentage specified.

As indicated by the percentages in State table 23, the smaller the number of farms reporting a given item, the larger the relative sampling error in the estimated total for that item. Even so, considerable detail is presented for each item, by sereral classifications of farms, in order to permit the appraisal of estimates for various combinations of items not shown in this report. Percentages and averages that may be derived from the tables will generally have greater relative reliability than the corresponding estimated totals. However, significant patterns of relationships may be observed in the estimated totals even though the individual data are subject to relatively large sampling errors.

The data represeuting estimates based on a sample of farms for the 1954 census were obtained in essentially the same way as in 1959. Therefore, State tables 23 and 24 may also be used to determine the sampling errors for the 1954 data.
Differences in Data Resulting From Differences in Tabulating Procedures.-Many of the figures in the detailed State tables represent estimates obtained by tabulating only the sample farms. The totals for these detailed distributions will generally differ somewhat from totals presented in other tables obtained from different distributions which were tabulated on a 100 percent basis. Moreover, although most of the figures presented by countles were obtained from tabulations of all farms, the data in county table 4 for commercial farms, and all of the data iu the county tables on dairy products and livestock sold, fertilizer and lime, farm expenditures, land-use practices, farm labor, facilities and equipment, and value of land and buildings were estimated for each county on the basis of data tabulated for the farms in the sample. The State totals in the counts tables for these items, though based also on the sample, were obtained in a different series of tabulating runs, and so may differ slightly from totals presented in some State tables. For reasons of economy the sample distributions were not adjusted to the 100 percent totals even when such totals were available, nor were slight discrepancies resulting from different runs of the sample data always reconciled unless the differences were large enough to affect the usefulness or reliability of the data.

## PROCESSING OPERATIONS

Completion of Enumeration.-As an enumerator completed his assignment, he turned the portfolio containing questionnaires and other census materials over to his crew leader. After making a final review of the enumerator's work, the crew leader mailed the portfollo to the Agriculture Processing Office at Parsons, Kansas. There, each enumerator portfolio was thoroughly checked for completeness of all required forms and for correct applleation of the sampling procedure.
Editing of Questionnaires.-Each agriculture questionnaire was individually edited and coded before the information was transferred to punch cards and tabulated. As the first major step in the editlng process, questionnaires that did not represent farms according to the census defnition were withdrawn from fur-
ther processing. (See p. XIV.) As the second major step, the remaining questionnaires were examined for errors, omissions, and inconsistencies. Among the specific items subjected to cousistency checks were the following:
a. Total acreage compared with its distribution by use.
b. Acreage of individual crops harvested compared with total cropland harvested.
c. Irrigated acreage compared with total acres in the farm.
d. Total acreage of individual crops for all purposes compared with the acreage harvested for specific purposes.
e. Quantity of crops harvested In relation to acreage harvested.
f. Sales in relatiou to production and, for livestock, to inventories.
g. Total livestock compared with the inventory by age and sex.
h. Expenditures compared with production and inventories.

Obvious errors in calculations or in units of measure, and misplaced entries were corrected as they were found. Entries not clearly legible were rewritten. Many omissions or inconsistencies were disregarded during editing. Those of significant magnitude could be and were handled more efficiently and economically during mechanical processing operations. Questionnaires containing major inconsistencies and omissions were referred to members of the technical staff for review. Depending on the magnitude of the data involved, the technical staff corrected (or supervised the correction of) the questiomaires either on the basis of information reported for other farms of similar type in the area or on the basis of additional information received in response to letters directed to the farm operators.
Coding of Questionnaires.-Most of the numerical information on a questionnaire was self-coding in that the inquiry number was utilized for the item identitication on punch carls or on tabulations runs. However, some manual coding was also necessary for such items as irrigated crops for selected States, crops infrequently reported, miscellaneous poultry, etc. Code numbers were entered on questionnaires to classify farms ant, in some cases, to identify data for individual items. All farms were coded by size of farm in terms of total acreage, by race, and hy tenure of operator. Farms in the 17 Western States, Louisiana, and Hawaii were also corled on the basis of irrigated cropland and irrigated pasture. Additional codes were applied to all farms inclnded in the sample to classify them by type of farm and by total value of agricultural products sold. Individual items were coded only where reports were received for crops or poultry not covered by separate inquiries on the questionnaire. This coding was necessary to assure inclusion of the data in the appropriate farm product totals.
Tabulation of Data.-After the questionnaires were edited and coded, the information on them was punched on cards. The cards were then mechanically sorted and fed into machines which transferred the data to tabulation sheets. One of the initial and primary steps in the machine handling of the punch cards was to separate and list those cards which lacked necessary information, those which contained inconsistent or impossible data, and those on which the data were possible but of such magnitude that a further review of the individual questionnaires was warranted. The listing sheets were examined and, as necessary, the cards were corrected. When the cards for a particular county were considered satisfactory, the data were tabulated.

Subject-matter specialists of the Bureau and the U.S. Department of Agriculture examined all tabulations for reasonableness and consistency. As necessary, they made corrections on the basis of a further review and reamraisal of the original reports and verification of the editing, coding, and punching.

## PRESENTATION OF STATISTICS

Statistlcal Content of This Report.-This report is part of Volume I of the 1959 Census of Agriculture. Volume I consists of 54 parts, each part containing information about agrlculture for a single State, Commonwealth, or Possession. Wach part contains county data for that particular state or area. The terns "county," as used in this report embraces election districts in Alaska, parishes in Louisiana, municipios (municipalities) in Puerto Rico, etc. The statistics for 1959 were obtained from the Census of Agriculture taken in the "conterminous United States" (see following paragraph). Hawaii, and Puerto Rico during the period October 1959 to January 1960 and in Alaska, American Samoa, Guam, and Virgin Islands as of April 1, 1960. Comparative data for years prior to 1959 were oblained from earlier censuses.

In the planning of the publications for the 1960 Censuses of Population and Housing and the 1959 Census of Agriculture, the term "conterminous United States," recommended by the Board of Geographlc Names to designate the 48 -State area as it existed before Alaska and Hawaii became States, was adopted by the Bureau of the Census.

The definitions and explanations in this introduction for volume I generally have application broad enough to include the States of Alaska and Hawaii, and the Commonwealth of Puerto Rico and the island possessions. However, specific application in many instances may be limited to the conterminous United States; for example, references to earlier censuses, to the sampling methods and procedures, to specific sections or questions on the questionnaires, and to specific table numbers.

For each part of volume I (one part for each State or area), a facsimile of the appropriate questionnaire is reproduced in the appendix.

The statistics for States and counties are presented according to the same general plan as was followed in the volume I reports for the 1954 and the 1950 censuses. State and county totals are given for nearly all items for which information was obtained in the 1959 census. However, most of the data by economic class of farm, type of farm, and color and tenure of farm operator are given only for States.

Comparative data for the States are given for each census year beginning with 1920. Comparative data for counties are given for the years 1959 and 1954. For some items, the data obtained from the 1959 census are the onls ones available. For comparative purposes 1050 data are carried in county table 6 for the kind of road on which farms were located.

Comparability of Data.-The data obtained from the various censuses of agriculture are not strictly comparable for all items. For example, differences from one census to another in the tlme of enumeration, the wording of the questions, and the definition of a farm cause some lack of comparability. Differences considered to have a significant effect on the comparability of data are described in the text and/or mentioned ln footnotes to the tables.

Minor Civil Divlsions.-As in prior censuses, data for most of the items included in the 1959 Census of Agriculture were tabulated for minor civil divisions. The term "minor civil division" applies to the primary subdivision of a county into smaller geographic areas such as townships, precincts, districts, wards, beats, municipalifies, etc. Figures for these smaller geographic areas are not included in any of the published reports, but they may be supplied upon request and payment of the costs of compiling and checking the data.

Prior to the 1954 Census, an enumeration assignment did not include more than one minor civil division, even in cases where the township, precinct, etc., did not have enough farms to provide a full workload for an enumerator. In 1954, and agaln in 1959,
the aim was to make enumeration assignments large enough to keep each enumerator fully occupied in his area for a 3-to 4-week period. Hence, in some areas, two or more adjoining minor civil divlslons were combined into one enumeration assignment. An enumeration assignment never comprised the whole of one minor civil division and a part of another, nor a part of two or more minor civil divisions. A minor civil division that included too many farms for one enumerator to cover during the enumeration period was divided into two or more enumeration assignments.

In some cases, the minor civil division tabulations provide totals for a single minor civil division, even when such totals required a grouping of enumeration assignments. In other cases, the minor civil division tabulations provide totals for a combination of two or more adjoining minor civil divisions. The data for each individual minor civil division included in such totals can be tabulated separately, however, since each questionnaire obtained in the census contains the designation of the minor civil division in which the farm headquarters was located. An additional charge must be made for a separate tabulation of any small area included in a total for two or more combined minor civil divisions.

Requests for census information for minor civil divisions should be directed to the Agriculture Division, Bureau of the Census, Washington 25, D.C.

## DEFINITIONS AND EXPLANATIONS

Descriptive Summary and References.-The definitions and explanations that follow relate only to those items that are considered to be inadequately described in the tables where they appear. Although the descriptive terms and explanations refer specifically to the 1959 Census of Agriculture, many of them also apply to earlier censuses. Most of the clefinitions consist of a résumé of the questionnaire wording, supplemented by excerpts from instructions given to enumerators. For exact wording of the questions and of the instructions included on the questionnaire, see the facsimile of the 1959 Agriculture Questionnaire in the appendix of this report.

An analysis of the questions asked in the 1959 census, and of the data obtained, is given in Volume II, General Report, Statistics by Subjects, United States Census of Agriculture, 1959. The general report presents statistics for States by subject matter.

## General Farm Information

Census Definition of a Farm.-For the 1959 Census of Agriculture, the definition of a farm was based primarily on a combination of "acres in the place" and the estimated value of agricultural products sold.

The word "place" was defined to include all land on which agricultural operations were conducted at any time in 1959 under the control or supervision of one person or partnership. (For definition of "agricultural operations", see p. X.) Control may have been exercised through ownership or management, or through a lease, rental, or cropping arrangement.

Ilaces of less than 10 acres in 1959 were counted as farms if the estimated sales of agricultural products for the year amounted to at least $\$ 250$. Places of 10 or nore acres in 1959 were counted as farms if the estimated sales of agricultural products for the year amounted to nt least $\$ 50$. Places having less than the $\$ 50$ or $\$ 250$ minimum estimated sales in 1959 were also counted as farms if they could normalls be expected to produce agricultural products in sufficient quantity to meet the requirements of the definition. This additional qualification resulted in the inclusion as farms of some places engaged in farming operations for the first time in 1959 and places affected by crop failure or other unusual conditions.

To aroid biases arising from an enumerator's personal judg. ment and opinion, the Bureau did not give enumerators the defini-
tion of a farm. Instead, enumerators were Instructed to ohtain questionnaires for all places considered farms by their operators and for all other places that had one or more agricultural operations. (See "Agricultural Operations", p. X.) In 1954, enumerators were instructed to till questionmares on the same basis as in 1959. In 1950, agricultural operations were defined to Include every place of 3 or more acres, whether or not the operator considered it a farm, and every place having "speclalized operations", regardless of the acreage. "Specialized operations" referred to nurseries and greenhouses and to places having 100 or more roultry, production of 300 or more dozen eggs in 1949, or 3 or more hives of bees. In all of the three last censuses, as a result, questionnaires were filled for a considerable number of places that did not qualify as farms. The determination as to which questionnaires represented farms was made during office processing operations and only those questionnaires meeting the criteria for a farm were included in the tabulations.
For both the 1950 and 1954 Censuses of Agriculture, places of 3 or more acres were counted as farms if the annual value of agricultural products, whether for home use or for sale but exclusive of home-garden products, amounted to $\$ 150$ or more. Places of less than 3 acres were counted as farms only if the annual sales of agricultural products amounted to $\$ 150$ or more. A few places with very low agricultural production because of unusual circumstances, such as crop failure, were also counted as farms if they normally could have been expected to meet the minimum value or sales criteria.

In the censuses from 1925 to 1945 , enumerators were given a definition of "farm" and were instructed to obtain reports only for those places which met the criteria. According to this definition, farms included all places of 3 or more acres, regardless of the quantity or value of agricultural production, and places of less than 3 acres if the value of agricultural products, whether for home use or for sale, amounted to $\$ 250$ or more. Because of changes in price level, the $\$ 250$ minimum resulted in the inclusion of varying numbers of farms of less than 3 acres in the several censuses taken during this period. Generally, the only reports excluded from tabulation were those taken in error and those showing very limited agricultural production, such as only a small home garden, a few fruit trees, a small flock of chickens, etc. In 1945, reports for places of 3 acres or more were tabulated only if at least 3 acres were in cropland and/or pasture or if the value of products in 1014 amounted to at least $\$ 150$.

The decrease in the number of farms in 1950 and 1954, as compared with earlier censuses, was partly due to the change in farm definition, especially with respect to farms of 3 or more acres in size. Some of the places of 3 or more acres that were not counted as farms in 1950 and 1954 because the value of their agrlcultural production was less than $\$ 150$ would have qualified as farms if the criteria had been the same as in earlier censuses.

For 1959, the decrease in the number of farms as compared with all prior censuses resulted partly from the change in farm definition. The fact that sales of agricultural products in 1959 was used resulted in the exclusion of some places that would have qualified as farms had the value of agricultural products alone been considered. The lncrease in the acreage minimum also had an effect. The reduction in the number of farms due to change in definition, 1954 to 1959, is shown for each county In county table 1. Some characteristics of the places not counted as farms in 1959, but which would have been included in 1954, are shown in State table 10.

The change in farm definition made ln 1950 and again in 1959 had no appreciable effect on the totals for livestock or crops because the places affected by the change ordinarlly accounted for less than 1 percent of the totals for a given county or State.

For the States that comprise the conterminous United States, two figures are published for each county on the number of farms
in 1959. One is an actual count of all farms and the other is an estimate based on the number of farms included in the sample. For almost every county there is a difference between the actual number of farms and the estimated number of farms. Because of samtling procedure and sampling variability, the number of farms in the sample seldom agrees exactiy with the actual number of farms. For most counties, the actual number of farms in the sample was either more or less than precisely 20 percent of all farms. Similarly, totals estimated on the basis of data for the sample farms may be slightly more or slightly less than the actual totals that would have been obtained had the data been tabulated for all farms. Therefore, the estinated number of farms reporting certain items may, in sone instances, be greater than the total number of farms shown in county table 1 . However, the estimated number of farms is given in county tables 5 and 6 so that estimates based on the sumple farms may be related to the estimated rather than the actual number of farms.

Farm Operator.-The term "farm operator" is useflto designate a person who onerates a farm, either doing the work himself or directly supervising the work. He may be the owner, a member of the owner's household, a hired manager, or a tenant, renter, or sharecropper. If he rents land to others or has land worked on shares by others, he is considered as operator only of the land which he retains for his own operation. In the case of a partnership, only one partner is counted as an operator. The number of farm operators is considered to le the same as the number of farms.

Farms Reporting or Operators Reporting.-Figures for farms reporting or operators reporting, based on a tabulation of all farms, represent the number of farms, or operators, for which the specified item was reported. For example, if there were 1,922 farms in a county and only 1,465 had chickens 4 months old and over on hand at the time of enumeration, the number of farms reporting chickens would be shown as $1,46$. . The difference between the total number of farms and the number of farms reporting a particular item renresents the number of farms not having that item, provided a correct report was received for all farms.

Where applicable, figures may be given for the number of farms or operators not reporting items that were intended to be obtained for all farms; for example, residence of farm operator, State table 4. The number not rejorting, as compared with the total number of farms or operators, indicates the extent of incompleteness of the reporting of the data for the item.
Land Area.-The approximate total land area of States and counties as reported for 10.50 is, in general, the same as that reported for all censuses beginning with 1940 . Such differences as are shown reflect political changes iu boundaries or actual changes in land area caused by changes in the number or size of reserwoirs, lakes, streams, etc. For Alaska, the areas for election districts represent the gross area of land and water.
Land in Farms.-Except for managed farms, the land to be included in each farm was determined from the answers to questions about the number of acres owned, the number of acres rented from others or worked on shares for others, and the number of acres rented to others or worked on shares bs others. The acres owned and the acres rented from others or worked on shares for others were first added together and then the acres rented to others or worked on shares by others were subtracted. The result represented the number of acres in the farm. The number of acres in a managed farm was the difference between the total land managed and that part of the managed land that was rented to others or worked on shares by others.

In the 1959,1954 , and 1950 censuses, enumerators were instructed to record total figures for land owned, land rented from others, and land managed for others, including any part of the land that was rented to others. In censuses prior to 1950, enu-
merators were instructed to exclude all land rented to others and to record only that portion of the acreage owned, rented from others, or managed for others that was retained by the farm operator. Thus, the figures for the individual tenures of land are not entirely comparable for all censuses. However, the land included in each farm was determined on essentially the same basis for all ceususes.

The aereage deslgnated in the tables as "land in farms" consists primarlly of "agricultural" land-that is, land used for crops and pasture or grazing. It also includes eonsiderable areas of land not actually under cuitivation nor used for pasture or grazing. For example, the entire aereage of woodland and wasteland owned or rented by farm operators is inchuded as land in farms, unless it was being heid for nonagricultural purposes or unless the acreage was unusually large. For 1959 and 1954, if a place had 1,000 or more acres of woodland not pastured and wasteland, and if less than 10 percent of the total acreage in the place was used for agricultural purposes, the acreage of woodland not pastured and wasteland was reduced to equal the acreage used for agriculture. The procedure used in 1950 for exeluding unusually large acreages of woodland not pastured and wasteland differed slightiy from the one used in 1959 and 1954. In 1950, adjustments were made in places of 1,000 or more acres ( 5,000 or more in the 17 Western States), if less than 10 percent of the total aereage was used for agrleultural purposes.

Except for open range and grazing land used under government permit, all grazing land was to be included as land in farms provided the place of wbich it was a part was a farm. Grazing land operated by Grazing Associations was to be reported in the name of the person ehiefly responsible for conducting the business of the Association. Land used rent free was to be reported as Iand rented from others. All land in Indian reservations that was used for growing erops or grazing livestock was to be ineluded. Land in Indian reservations that was not reported by individual Indians and that was not rented to non-Indians was to be reported in the name of the cooperative group that used the land. In some instances, an entire Indian reservation was reported as one farm.

Land owned.-All land that the operator and/or his wife held under title, purchase contract, homestead law, or as heir or trustee of an undivided estate at the time of enumeration is considered as owned.

Land Rented from Others.-This item includes not only land that the operator rented or leased from others but also land he worked on shares for others and land he oceupied rent free. Grazing land used under government permit or license is not included.

Land Rented to Others.-Thls item ineludes all land rented or leased to others, except land leased to the government under the Soil Bank, and all land worked by others on shares or on a rent-free basis. For the most part, the land rented to others represeuts agricultural land but lt also includes land rented for residential or other purposes. The tenaut or sharecropper is eonsidered as the operator of land leased, rented, or worked on shares even though his landlord may supervise his operations. The landiord is eonsidered as operator of only that portion of the land not assigned to tenants or eroppers.

Land Managed.-This item includes afl tracts of land man. aged for one or more employers by a person hired on a salary basis. A hired manager was considered to be the operator of the land he managed since he was responsible for the agricultural operations on that land and frequently supervised others in performing those operations. Managed land was always to be reported on a separate questionnaire whether or not the manager aiso operated a farm on his own account.

Land in Two or More Counties.-An individual farm was always enumerated in only one county, even in eases where the land was lorated in two or more counties. If the farm operator lived on the farm, the farm was enumerated in the county where he lived. If he did not live on the farm, the figures for the farm were tabulated for the counts where the farm headquarters was located. In cases where there was any question as to the location of the headquarters, figures for the farm were tabulated for the county where most of the land was located.

Land in Farms According to Use.-Land in farms has been distributed aceording to the way in which it was used in 1959. The land uses deseribed in the following paragraphs are mutually exclusive; that is, each acre of land is inciuded only once even though it mas have had more than one use durlng the year.

Cropland Harvested.-This category refers to all land from which any crops were harvested in 1959 , whether for home use or for sale. It intludes land from which hay (ineluding wild hay) was cut and land in berries and other small fruits, orehards, vineyards, nurseries, and greenhouses. Matured crops hogged off or grazed were considered to have been "erops harvested" and were reported here. Land from which two or more crops were harvested in 1959 was to be counted only once la the land-use classification. Land used for other purposes either before or after the crops were harvested was to be reported as eropland harvested, without regard to the other uses.

The enumerator was instructed to check the figure for cropland harvested for each farm by adding the acreages of the individual crops and subtracting the acreages from which two or more crops were harvested. This cheeking procedure was repeated during the office processing of questionnaires for all farns having 100 or more aeres of cropland harvested.

Cropland used only for Pasture.-This land-use classification includes rotation pasture and all other land used only for pasture or grazing that the operator considered could have been used for erops without additional improvement. Enumerators were instructed to include land planted to erops that were hogged off, pastured, or grazed before maturity but to exclude land pastured before or after hay or other crops were harvested from it. Permanent open pasture may have been reported either for this item or for "other pasture" depending on whether or not the operator considered it as eropland.

The figures for 1945 and eariier censuses are not entirely comparable with those for the last three censuses. For 1945 , the figures Include oniy cropiand used solely for pasture in 1944 that had been plowed within the preceding seven years. The figures for 1940,1935 , and 1925 are more nearly comparable with those for 1959, 1954, and 1950, however, beeause they include land pastured that could have beeu plowed and used for erops without additional clearing, draining, or irrigating.

Cropland not Harvested and not Pastured.-This elassification represents a total of three subciasses for the 17 Western States and two subclasses for other States.

Cultivated Summer Fallow.-This suhclass of land is shown oniy for the 17 Western States. It refers to cropland that was plowed and cultivated but left unseeded for the 1959 harvest in order to control weeds and conserve moisture.

Soil Impravement Grasses and Legumes.-For the 1959 census, land used only for cover crops to eontrol erosion or to he phowed under for ereen manure is tabulated separately from "other cropland". After the establishment of the Soil Bank. land that would normanly have been used for other purposes was frequently planted to soil-improvement crops. In counties where large acreages were inaced in the Soil Bank, the total of land used for soil-improvement crops phas "other cropiand" mas the considerabiy larger than the "other erophand" shown for previous censuses.
Other Cropland.-This subclass includes idle eropland, land in crops intended for harvest after 1959, and cropiand not barvested because of complete crop failure, low prices, labor shortage, or other reasons. The 1959 figures for "other cropland" are not entirely comparable with those for previous censuses since they do not inciude land used only for soil-improvement crops. (See preceding paragraph.)
Woodland Pastured.-This classifieation ineludes all woodland where fivestock were pastured or grazed in 1959. The instruetion on the questionnaire-"Inciude as woodiand all wood lots and timber traets; cutover and deforested land which has value for wood products and has not been improved for pasture"-represents a somewhat more precise definition than the corresponding instruction contained on the 1954 questionnaire. No definition of woodiand was given in 1950 apart from an instruction to enumerators not to include brush pasture as woodland. Some of the ehanges in woodland aereages from one census to another mas merely remresent differences in interpretation as to what eonstitutes "woodiand."

Woodland not Pastured.-This elassifieation refers to all Woodland not used for tasture or grazing in 1959, inciuding land in operated farms that was placed in the Soil Bank and planted to trees. Unusually large tracts of timberland that were reported as woodiand not pastured were excluded from
the tabulation of land in farms when it was erident that such land was held primarily for nonagricuttural purposes.

Other Pasture.-This classification refers to all tand otther than woodland and cropland that was used only for pasture or grazing in 1959. It inctudes noncrop open or brush pasture and cutover or deforested tand that has been improved and used for pasture. The figures for the last three censuses are comparabte but those for 1945 include atl nonwoodtand pasture that had not been plowed during the preceling seven years. For the 1940 census and eartier years, the figures are more nearly comparable with those for the last three censuses. However, the classification mas be somewhat tess inclusive because land that coutd have been plowed and used for crops without additional clearing, draining, or irrigating was classified as plowabte pasture and included with "croptand used only for pasture".

Inıproved Pasture.-This subclass refers to that portion of "other pasture" on which one or more of the fottowing practices had been used: fiming, fertilizius, seeding, irrigating, draining, or the clearing of weed or brush growth. The figures are comparable with those for 1954 , when the question on improved pasture was asked for the first time.
Other Land.-This classification refers to all land not included in the preceding land-use classifications, such as house lots, barn lots, lanes, roads, ditches, land area of ponds, and wasteland. Thls figure for 1959 was obtained from the machine tabulations by subtracting the total of all other uses from the total land in alt farms reported for a given county or classification. Hence, there is no figure given to represent the farms reporting this item.
Value of Land and Bulldings.-Only average values of land and buildings per farm and per acre are presented in this report. They are estimates based on data obtained for sample farms. Estimates of the total ralue of land and buildings by States, geographic dirisions, and the United States, are presented in volume II.

The enumerator was instructed to record the market value of the land and the buildings on that land. Market value was defined as the price wbich the farm operator would expect to receive for the land and buildings if he were to sell them on the das of enumeration.

More problems and difficulties arise in the enumeration of farm-real-estate values than in the enumeration of most other agricultural items. Most of the items enumerated require the respondent to make a statement of fact. For example, information about the number and value of farm animals sold alive during the year is based on actual transactions. Similarly, information about livestock inventories relates to the situation existing on a specific place at a specific time. Reports concerning the vatue of land and buiłdings, however, are esthnates based almost entirely on opinion. The majority of farms have not changed hands for many years and are not currentty for sale. For such farms, the operators are not likely to hare any clear basis for estimating the value. To make an lntethigent and objectire estimate, a respondent first needs to make an estimate of the prevailing average market value of farms in his communlty. Then, he must either add to or subtract from that estimate to allow for the different characteristics of his own farm. In many cases, an operator who would not sell his farm under any circumstances may report an unreasonably high market value. In other cases, a farm operator who acquired his real estate during a period of relatively low prices may estimate an unrealisticatty low ralue by current standards. Because of the extent of variation that is known to exist in real estate ralues, it is difficult to devise checking procedures that will identify inaccurate estimates.
Age of Operator.-Farm operators were classified bs age into six age groups. The average age of farm operators was derived from the sum of the ages of all farm operators reporting age divided by the number reporting. The number of farm operators 65 or more years of age is an actual count based on the operators reporting age.

Residence of Operator.- Farm operators were classithed by residence according to whether or not they tived on the farms they were operating. Some of those who did not live on the farms they oferated themselves fived on farms operated by oticers. In cases where alt the land was rented from others or worked on shares for others, the operator was considered to live on the farm operated provided the dwelling he occupiet was inctuted in the rental agreement. The dweltine, in such cases, was not necessarily on the land being operated. Similarly, a farm oferator who did not live on the tand being cultivated or grazed but who had some agricultural operations (other than a thome gardeu) at his dwetting was considered as living on the farmoperated.

Since some farm ofecrators live on their farms only during a part of the year, comparability of the figures for various censuses may be affected by the date of enumeration.

In a few cases, the enumerator faited to report the residence of the farm operator. Differences between the total number of farms and the number of farm operators classitied by residence indicate the extent of under-reporting.

Year Began Operating Present Farm.-Fnumerators were instructed to report the year during which a farm operator began to operate his present farm and, if the year was 1958 or tater, also to report the month. The year was intended to refer to the first year of the period during which the operator had been in continuous charge of his present farm or of ans part of it. The time of year that farmers move is indicated by the month they began operating their farms, as shown by a monthis breakdown of the reports for farmers who began operating their present farms during 1958 and 1959.

Off-Farm Work and Other Income.-To obtain a measure of the extent to which farm operators rely on nonfarm sources for part of their income, four questions were asked of atl farm operators. The first question asked for the number of days the onerator worked off his farm in 1959. The other three questions, to be answered "Yes" or "No," asked (1) whether other members of the operator's housebold did any work off the farm ; (2) whether any income was received from sources other than the sate of agricultural products from the farm operated; and (3) whether the combined income of ath members of the househotd from off-farm work and other sources was greater than the total value of agrlcultural products sold from the farm operated.
Off-farm work was defined to include work on someone else*s farm for pay as well as all types of nonfarm jobs, businesses, and professions, whether the work was done on the farm premises or elsewhere. Exchange work was not included.
The questions asked in the 1959 Census are closely comparable with those asked in 1954 . The data for 1959 are actual totals of all operators reporting off-farm work and other income whereas those for 1954 are estimated totats based on the sample.

Equipment and Facilities.-In 1929 as in several earkier censuses, data about specified equipment and facilities were obtained for only a sample of farns. Farm operators were asked to report equipment and facilities that were on the farm at the time of enumeration, regardless of ownership. They were to include items that were temporarily out of order but not any that were worn out.

Data in terms of actual number were obtained for the following items of farm equipment in 1959 : (1) grain combines, (2) corn pickers, (3) pick-up baters, (4) field forage harvesters, (5) motortrucks, (6) wheel tractors, (7) garden tractors, (8) crawter tractors, and (9) automobiles. Definitions given enumerators included the following specifications, among others: Corn pickers related to alt types of machines used for picking corn, whether used in separate or in combined picking-shelling operations. Pick-up balers were to inctude both hand-tie and autmatic balers but not stationary ones. Motortrucks were to include pick-up trucks and truck-trailer combinations; jeeps and station wagons
were also to be included if they were used primarily as trucks, but school buses were specifically excluded. Wheel tractors specifically excluded garden tractors, implements with built-in power units, such as self-propelled combines or powered buck rakes, and the power unit of a truck-trailer combination. Automobiles were to include jeeps and station wagons if they were used primarily as passenger cars.

Questions to be answered "Yes" or "No" provided information as to the presence or absence of the following items: (1) telephone, (2) bome freezer, (3) milking machine, (4) electric inilk cooler, (5) bulk-type milk cooler (ln slx States only-Michigan, Minnesota, New York, Obio, Pennsylvania, and Wisconsin), (6) crop drier and (7) power-onerated elevator, conveyor, or blower.

Contparable data from one census to another are not available for all items. The questions asked about equipment during a given census reflect changes in farm mechanization and in the facilities available to farm families. Questions about some items of equipment were asked in 1959 for the first time (electric milk cooler, crop drier, bulk-type milk cooler, etc.). Similarly, some questions that were asked in earlier censuses were omitted in 1959. For example, the use of electricity is now so widespread that there is no longer any need for obtaining a count of the farms having it.

Farms by Kind of Road.-The classification of farms by the kind of road on which they are located is based on only a sample of farms. The enumerator was instructed to report, on the basis of his own observation, the kind of road on which the most frequently used entrance to the farm was located. For farms consisting of two or more tracts, he was to limit his report to the tract on which the farm operator had bis dwelling or other headquarters.

Farm Labor.-The questions ahout farm labor were asked only for the sample farms and related to persons working during the calendar week preceding the week of enumeration. Since the enumeration starting dates varied by geographic areas, and the enumeration within each area lasted over a period of several weeks, the calendar weeks to which the data apply also vary. Thus, the data for an individual farm may relate to any one week during the months of October, November, or December, or even, in a few instances, to weeks during September 1959 or January 1960.

Farm labor was defined to include any work, chores, or planning necessary to the agricultural operations of the farm ; and to exclude housework, contract construction work, custom machine work, and repair, installation, or construction work done by persons employed specifically for such work. The farm labor iuformation contained in this report represents estimates based on answers to questions relating to the farm work or chores done during the week by (1) operator, (2) unpaid members of the operator's family, and (3) hired persons. An operator was considered as working if he worked one or more hours; unpaid members of the operator's family, if they worked 15 or more hours; and hired persons, if they worked at all during the week.

Data are not fully comparable from one census to another, primarily because of dferences in the period to which they relate. In 1954, the data were purposely related to either one of two calendar weeks, depending in part on the starting date set for the enumeration and in part on which week represented a period of peak employment within a given State. For the majority of States, the period specified was the week of Sentember 26-October 2 ; for other States, the week of October 24-30.

In 1950 , as in 1959, the data related to the week preceding the actual enumeration. Unlike 1959, however, enumeration starting dates were identical for alf States in 1950 (April 1) but since several weeks were required to complete the enumeration, the calendar week preceding the enumeration was not identical for
all farms. In 1945 and 1935, the number of farm workers related to the first week in January and, in 1940 , to the last week in March. In 1945, 1940, and 1935, only persons working the equivalent of two or more days during the specified week were to be included. In 1945 and 1940, an additional specification limited the workers to those 14 years old and over.

Experience gained from earlier censuses indicates that farm labor data are often unsatisfactorily reported unless the week specified is the week immediately preceding the actual enumeration. When a farm operator was asked to report the number of persons employed during a specified week that was several weeks prior to enumeration, he often reported the highest number of persons employed during the year. Obviously incorrect reports were adjusted to make the data reflect more nearly the situation known to exist during the specified week. The farm labor data for 1954 relates to a specified week which, in some cases, was several weeks prior to enumeration. Few adjustments were made in those data, however, even though there were indications of incorrect reporting.

Regular and Seasonal Workers.-Hired persons working on the farm during the week concerned were classed as "regular" workers if the period of actual or expected employment was 150 days or more during the year. They were classed as "seasonal" workers if the period of actual or expected employment was less than 150 days. In cases where the period of employment was not reported for an individual farm, it was estimated from data for such items as basis of payment, wage rates, expenditures for labor in 1959 , and type of farming operations.

Hired Workers by Basis of Payment.-Hired persons were also classified according to whether they were paid on a monthly, weekly, daily, or hourly basis, or by piecework. In cases of incomplete reporting, the basis of payment for hired workers was supplied during the office processing operations.

Wage Rates and Hours Worked.-The agreed cash rate of pay was asked for each class of hired worker except those employed on a piecework basis. (The number and the earnings of persons paid on a piecework basis were required for those who worked on Friday of the week preceding the enumeration.) The number of hours that workers were expected to work to earn their pay was asked for each class except those employed on an hourly or piecework basis. For 1959 and 1954, the data include office estimates for farms subntitting incomplete reports of wage rates and hours worked. The estimates were consistent with the size and type of operations for the individual farm as compared with similar farms in the area for which complete reports were received. The corresponding data for 1950 apply only to farms that reported both wage rates and hours worked.
Fertllizer and Lime.-The questions about fertilizer and lime, asked only for the sample farms, relate to the acreage on which fertilizer and lime were used and to the quantity used. Farm operators were asked to report total quantities used in 1959 on the farms they operated regardless of when or by whom the fertilizer and lime were purchased. In the south, some landords who operated farms themselves included the fertilizer and lime they had purchased for use on their tenant-operated land. Such fertilizer and lime may also have been reported by the tenants. When double reporting was detected during the editing process, the data on the questionnaires concerncd were adjusted to eliminate duplication in the totals.

The 1959 data for fertilizer and lime are entirely comparable with those for 1954. A breakdown between dry and liquid fertilizing materials was not obtained in 1051 and rata on cost of either fertilizer or lime were not obtained in 1959.

Fertilizer. - The report for fertitizer was to refer onty to commercial fertilizer and fertitizing materials, including rock phosphate. The acres fertilized and the tons of fertifizer applied to those acres were obtained separately for selected crops. The selected crops varied by region so that it was possible to obtain detaiked data for the crons most commonly fertilized in each region. In cases where the same latd was used for more than one crop, the acres fertilized were to be reported separately for each crop. If the same crop was fertitized more than once, however, the acres in that crop were to be reported only once. In alf cases, the total quantity of fer-
tilizer used $\ln 1959$ was to be reported, including quantities used on land occupied by crops phated in 1958 or by crops to be harvested in 1960.
Reports for quantity of fertilizer and fertilizing materials used were required for both dry and liquid materials. The terms "dry" and "liquid" referred to the form in which the fertilizers and fertilizing materials were purchased and not to the way in which they were applied. Thus, dry fertilizers were those purchased in dry or solid form, as powders, dusts, granules, pellets, etc.; liquid fertilizers were those purchased in fluid form, as solutions or as liquefled gases.

Llme.-The data for lime relate to the total acreage limed in 1959 and the total tonnage of lime and liming materials used on those acres for purposes of couditioning the soil. Instructions on the questionnaire stated that ground limestone, hydrated and burnt lime, marl, and oyster shells were to be included but that lime used for spraying or sanitatiou purposes was to be omitted.

For some counties, the tonuage of lime shown in the table may be less than the tonnage reported for the Agriculture Conservation Program or the Conservation Reserve Program of the Soll Bank. Differences may be due either to sampling error or to under-reporting by farm operators. Many of the differences are minimized or eliminated entirely in the data presented on a State or regional basis.
Specified Farm Expenditures.-The data for farm expenditures are estimates based on reports obtained from the sample farms. The 1959 questionnaire contained questions for six items of farm expenditure: (1) purchase of feed for livestock and poultry, (2) purchase of livestock and poultry, (3) machine hire, (4) hired labor, (5) seeds, bulbs, plants, and trees, and (6) gasoiine and other petroleum fuel aud oil. With the exception of items (2) and (5), exactly the same questions were asked in 1954. For each item specified, the total expenditures made for the farm in 1959 were to be reported, whether made by the farm operator, his landlord, or both. A farm operator who rented part of his land to others was to report only the expenditures for the land he operated himself. Enumerators were instructed to ask respondents who had difficulty estimating their expenses for the period between enumeration and the end of the year to estimate them on the basis of current costs.

Feed.-The report on feed purchased for livestock and pouitry was to include expenditures for grain, hay, millfeeds, pasture, salt, condiments, concentrates, and mineral supplements as well as for the grinding and mixing of feed. The estimated cost of items furnished by a landlord, coutractor, or other owner for feeding poultry and livestock kept on the farm was also to be included. Payments made by a tenant to his landlord for feed grown on the tenant farm were to be exciuded.

Livestock and Poultry.-The cost of baby chicks and turkey poults was to be included in the expenditures made for the purchase of livestock and poultry. Enumerators were instructed to ask the farm operator to include the cost or estimated purchase value of poultry and livestock provided by others and cared for by the operator under a contract feeding arrangement. The cost of livestock purchased for resale within 30 days was not to be included. A short-term transaction of that nature was cousidered to be a dealer operation, not an agricultural one.

Data on the purchase of livestock and poultry were not obtained in 1954 . The instructions for the 1950 census speciffed that expenditures for domestic rabbits, fur-bearing animals kept in captivity, and bees were to be included. Any lack of comparability in the 1950 and 1959 data resulting from lnclusion or exclusion of rabbits, fur-bearing animals, or bees is considered to be so slight as to be insignificant.
Machine Hire.-Expenditures for machine hire relate to custom machine work, such as tractor hire, threshing, grain or seed combining, silo filling, baling, cotton picking, cotton ginning, corn picking, plowing, vegetable harvesting, fruit picking, spraying, and dusting. Any amount spent for the labor included in the cost of machine hire was to be considered as part of the total expendlture. The cost of freight or trucking and exchange work without pay were to be omitted.

Hired Labor.-Expenditures for hired labor were to include total cash payments made in 1959 to family menibers and to others for farm labor. Payments to persons supplied by a contractor or a cooperative organization and paid directly by them or by the crew boss were also to be included. I'ayments
for the following types of work were to be excluded: housework, contract construction work, custom machine work, and repair, installation, or coustruction work done by persons specifically employed for such work.
Gasoline and Other Petroleum Fuel and 011.-Expenditures for gasoline and other letrolemul fuel and oil were to relate omly to the products used in the farm business. Enumerators were instructed to exclude the cost of petroleum products used for the family automobile when operated for other than farm business purposes and of products used in the farmhouse for heating, cooking, and lighting.

Seeds, Bulbs, Plants, aud Trees.-Expenditures were to represent the total amount spent for seeds, bulbs, plants, and trees to be used on the farm operated. The value of seed grown on the farm was to be excluded. For nurserles and greenhouses, the cost of products purchased for immediate resale was aiso to be excluded.
This item of expenditure was not included in the 1954 Census. The data are comparable with those for 1950, however.

## Crops

Crops Harvested.-The 1959 agriculture questionnaire was similar to the questionnaire used in several previous censuses in that it provided for the collection of detailed data for all crops harvested on each lndividual farm. The varlation $\ln$ the crops listed on the questlonnaires used in different States made posslble the separate reporting of all important crops grown $\ln$ a given area. All rerslons of the questionnaire contained several "All other crops" questions where crops not specifically listed in separate questions were to be reported.

Acreage of Crops Harvested. - In most lnstances, the acreage reported for individual crops represents the area harvested during 1959. The area harrested is often less than the area planted. For fruit orchards and groves, vineyards, and planted nut trees, the acreage reported represents the total area in both bearing and nonbearing trees and vines as of the date of enumeration-usually a date in October, November, or December 1959 . For soybeans, cowpeas, and peanuts, the acreage grown for all purposes was reported as well as the acreage harvested for srecific purposes. For velvet beans, only the acreage grown was reported. As the enumeration was about to begin in South Florida (those counties in which the enumeration was begun on October 7), an instruction was issued to the effect that the data for regetables and potato crops should relate to a full year, beginning on October 1,1958 , and ending September $30,1959$.
Quantity of Crops Harvested.-Except for citrus fruits, olives, avocados, and for vegetable and potato crops in South Florida (see preceding paragraph) data for quantity harvested relate to the calendar year 1959. For cltrus fruits, the quantity harvested from the bloom of 1958 for the $1958-59$ marketing season was to be reported. For ollves, the crop harvested in 1959 was to be reported for all States except California and Arizona. Enumerators in those two States were instructed to report olives harvested from the bloom of 1958 during the $1958-$ 59 barvest season (September 15, 1958, to February 2S, 1959). In the case of avocados, the data for California were to relate to the quantity harvested from the bloom of 1958 for the marketing seasou that extended from October 1, 1938 to September 30, 1959 ; the data for Florida were to relate to the crop harvested for the marketing season that extended from July 1, 1959, to February 28, 1960. Respondents were to estimate quantities not set harrested at the time of enumeration.

Unit of Measure.-The unit of measure in which quantities were to be reported has raried for some crops, not only from State to State, but also from census to census. The aim has been to permit reporting in the units of measure currently in use. In the State and county tables, the quantities harrested for each crop are usually expressed in the unit of measure given on the 1959 agriculture questionnaire. In 1959, for corn and Irish potatoes, a choice between two units in which to report the production was given in some States. (See the discussion for those crops.) To provide readily conmarable lnformation, data published in earlier reports in different units of measure generally have been converted to the units used in 1959.

Corn.-In the 19.59 census, detalled questions regarding the purpose for which corn was harvested were asked in all States. For most States, bushels was the only unit specified for corn
for grain. lu some areas, however, where farmers were not aceustomed to using bushels as the unit of measure, the questionnaire contained a provision for the quantity of corn for grain to be reported either in bushels (slielled basis) or in baskets of ear corn. As in former censuses, some reports were received In units of measure other than bushels or baskets. Prior to tabulation, all reports were converted to busliels (shelled basis) on the basis of the following factors: 70 pounds of ear corn, 2 baskets of ears, or 56 pounds of shelled corn equal one bushel. A barrel of ear corn was usually considered equal to 5 bushels of shelled corn.

Annual Legumes.-Mor soybeans, conveas, and peanuts, the acres and quantity grown or harvested for specifie purposes, as well as the total acreage grown for all purposes, were obtained for areas where these crops are grown extensively; for velvetbeans, only the total grown for all purboses was obtained. For all these crops except, possibly peanuts, the total acreage grown for all purposes includes some acreage that was plowed under for green manure. In a few Southern States, separate figures were obtained for the acres grown alone and the acres grown with other crops. In 1959 , as in 1954 , enumerators were instructed to report green soybeans and blackeyes and other green cowpeas harvested for sale as regetables and not as annual legumes.

Hay Crops.- Mata for the total acres of land from which hay was cut exelude the acreage in sorghum, soybean, cowpea, and peanut hays. These crops were reported in separate questions in the States where they are important. To obtain the total acres from which other hays were cut, the acres of the various hay crops, including grass silage, were added together for each county. The eorresponding totals for 1954 were obtained by the same procedure. For the 1950 census, however, the totals were based on farmers own reports of their total acreage in harvested hay erops.

The questionnaire contained an instruction that if two or more cuttings were made from the same land, the total produetion from all cuttings was to be reported but the acres cut were to be counted only once. In eases where both hay and grass silage were cut from the same land, the total acreage was to be reported for both crops. In 1959, as in 1954, alfalfa hay included alfalfa and alfalfa mixtures for hay and for delyyrating; clover and timothy hay ineluded clover, timothy, and mixtures of clover and grasses; small grain hay included oats, wheat, barles, rye, or other small grains cut for hay. The hay crops listed on the questionnaire varied somewhat from one State or region to another. The kinds of hay to be included in separate questions can be determined for a specifie State from reference to the facsimile of the questionnaire that is in the appendix.

The tonnage of hay, including alfalfa bay for dehydratlng, is given on a dry-weight basis. Prior to tabulation, production reported in green weight was converted to its dry-weight equivalent by dividing by 3 . However, the production of grass silage is given in terms of green weight.

Field Seed Crops.-The field seed crops listed on each rersion of the questionnaire were limited to those considered most important within the given State. Wach version of the questionnaire contained space for listing other field seed crops in order to facilitate the reporting of all field seed crops harvested. Quantity harrested was to be reported in terms of clean seed for most field seed crops. Bluegrass, or Junegrass seed, was to he reported in terms of green seed for Iowa, Kansas, Kentucky, Minnesota, Missouri, Nebraska, North Dakota, South Dakota, and Tennessee. No mention was made of "green-weight basis" for other States where this erop was to be reported in the "All other" question.

Irish Potatoes and Sweetpotatoes.-For Irish potatoes and sweetpotatoes (including yams), the total quantity harvested was to be reported for each crop in all cases, whether harvested for
home use or for sale or whether used for livestock feed. The acreage harvested was to be reported for each crop only in cases where the quantity amonnted to 20 or more bushels (or the approximate equivalent in terms of hundredweights, barrels, or pounds, as explained on different fersions of the questionnaire). This method of reporting was designed to facilitate the enumeration of potatoes harvested on small plots for home use. Essentially the same procedure was followed in both 1954 and 1950. In earlier censuses, however, the aereage of Irish potatoes and sweetpotatoes was to be reported in all cases, even when production was solely for home use. Therefore, the data on acres for censuses prior to 1950 are not fully comparable with those for the last three censuses, especially in counties or States where jroduction is largely for home use.

The unit of measure in which quantly was to be reported varied from one State or region to another to correspond with the units most commonly used in a given area. In 27 States, the questionnaire provided a choice for reporting elther bushels or 100-pound bags (hundredweights). The published data for counties and States are in terms of busheis.

Berrles and Other Small Fruits.-The question for berries and other small fruits related specifically to the acreages and quantlties harvested for sale. Only tame or cultivated berries were to be reported except for the New England States, where wlld blueberries were also to be included. Enumerators were instructed always to report the total quantity of each kind of berry harvested for sale but to report the area harrested only when it amounted to one-tenth acre or more. Nonbearing areas and areas and quantities harvested for hone use were to be exciuded. The data for 1959 and 1954 are fuily comparable.

Tree Fruits, Nuts, and Grapes.-In 1959, as in 1954, fruit trees, nut trees, and grapevines were not enumerated for farms having a combined total of less than 20 at the time of enumeration. Both bearing and nonbearing trees and vines were to be included but not any that had been abandoned. For censuses prior to 1954, all fruit or nut trees and grapevines on the farm were to be enumerated, regardless of the number. Because of this change in enumeration procedure, the data for 1959 and 1954 are not fully comparable with those for earlier censuses. In commercial fruit-producing counties, the change in procedure may have had a considerable effect on the number of farms reporting without eausing any significant changes in the number of trees and vines nor In the quantity harrested. In counties where most of the trees or vlnes are in small plantings and where production is largely for home-use, however, the change may have caused a significant reduction not only in the number of farms reporting but also in the number of trees and vlnes and in the quantity harvested.

In both 1959 and 1954 , the area in fruit orchards, groves, vineyards, and planted nut trees was enunierated when there were 20 or more fruit trees, nut trees, and grapevines. In 1950, the corresponding area was enumerated only If It amounted to one-half aere or more. In censuses prior to 1950, the area was to be reported regardless of lts slze or of the number of trees and vines. Enumerators frequently omitted the fractional acreages in small plantings and home orehards, however. In some countles, small plantings or home orehards comprise a sizeable proportion of the total frult and nut acreage. For those counties, the change from one census to another in aereage of land in fruits and nuts may not be due to fact but merely to differences in enumeration.

In 1959 , California was the only State for which the acreage in eaeh individual frult and nut crop was obtained. In 1954, such aereage was also obtalned for Arizona. In all States, the number of bearing and nonbearlng trees or vines on the farm at the time of enumeration and the quantity harvested ln 1959 were to be reported separately for each frult and nut erop. (Exceptlons in the harvest period for citrus fruits, avocados, and
olives are described on p. XIX.) The unit of measure in which quantities were to he reported varied from one State to another. Tables in this report show quantities in the unit of measure appearing on the 1959 questiommaire used in the State.

Nursery and Greenhouse Products.-The questions ahout nursery and greenhouse products related only to products grown on the place for sale. Crops bought for resale without additional cultivation were to be excluded. The area used for growing and the value of sales were to be reported separately for each of three groups, as follows:
a. Nursery products, (trees, shrubs, rines, and ornamentals).
b. Cut flowers, potted plants, florist greens, and bedding plants. For these items, the area grown in the onen was to be reported separately from the area grown under giass.
c. Vegetables grown under glass, flower seeds, regetable seeds, vegetable plants, bulbs, and mushrooms. For these items, the area grown in the open was to be reported separately from the area grown under glass or in the house.
The data obtained for 1959 are comparable with those for 1954 and 1950 since the questions asked were essentially the same in the three censuses. Detailed data regarding the production and sale of nursery, greenhouse, and other horticultural products on farms having sates of $\$ 2,000$ will be published 10 volume V, part 1.

Forest Products.-The forest products data ohtained in the Census of Agriculture relate only to the products cut on farms. Commercial logging, timber operations, and forest products grown or cut on nonfarm places are excluded. Therefore, the data in this report do not represent the total forestry output or income for a county or State.

The questions included on the 1959 agriculture questionnaire are more detailed than those asked in the 1904 Census. Value was obtained for the sale of standing timber or trees and for the sale of poles and piling, bark, bolts, and mine timbers. The quantity cut, whether for home use or sale, and the quantity sold were obtained for individual forestry products such as firewood and fuelwood, fence posts, sawlogs and veneer logs. Data relating to pulpwood, Christmas trees, maple trees, and maple syrup were obtained in States where such products are important commercially.
Value of Crops Harvested.-The totat value of crops harvested represents the estimated value of all crops harvested during the crop year 1959. It includes the value of quantities consumed on farms as food, feed, seed, ete., as well as quantities sold. Farmers were not asked to report values of crops harvested; the values were calculated in the Processing Office. For individual crops, the quantity harvested was multiplied by the average price at which the crop was sold in the State. State average prices were furnished to the Bureau of the Census by the Agricultural Marketing Service of the U.S. Department of Agriculture. They are based on reports received from a sample of farmers and dealers. Quantities harvested were not obtained for vegetables nor for nursery and greenhouse products. Therefore, for those crops, the value of sales, as obtained in the enumeration, was used in the calculation of total value of crops harvested.

Value of Crops Sold.-The questionnaire required value of sales of crops to be reported only for total vegetables, nursery and greenhouse products, and certain forest products. For all other crops, the value of sales was calculated on a county level during processing operations by multiplying the State average prices by either the quantity sold or the quantity harvested. Reports of quantity sold were obtained during the enumeration only for some of the major field crops. Quantity harvested was used in the calculation of value of crops sold for such crops as cotton, tobacco, etc., that are customarily grown for sale. The procedures used for the various crops are described on page XXV. They
are simllar to the procedures followed in 1954. In 1950, values of crops sold were obtained for each farm during the enumeration.

## Ibeigation

Definition of Irrigated Land.-Irrigated land is defined as land watered for agricultural purposes by artificial means. These means included subirrigation as well as systems whereby water was applied to the ground surface, either directly or by sprinkters. Land flooded for rice cultivation was considered as irrigated. Land flooded during high-water periods was to be included as irrigated only if water was directed to agricultural use hy dams, canals, or otber works. The definition of irrigated land specifically excluded land where the "water table", or natural level of underground water, was controlled by drainage works with no additional water brought in by canals or pipes.

Enumeration of Irrigated Land.-A question on total land irrigated was asked in all States, with the exception of Alaska. The acreage reported for this question includes not only irrigated cropland but also any other land that was irrigated in 1959.

The questionnaires used in the 17 Western States, Louisiana, and Hawaii included several additional questions regarding irrigation. These questions related to the acreage of land irrigated by sprinkters, irrigated land from which crops were harvested, specific crops irrigated, and source of irrigation water. Such additional data, for irrigated farms, are presented in county table 1a for these States.

Statistics on the irrigation enterprises which supplied irrigation water were collected in the 1059 Census of Irrigation and are published in Volume III, "Irrigation of Agricultural Lands" This report contains a considerable amount of data about irrigation for the 17 Western States and Louisiana.

Irrigated Farms.-All farms reporting any land irrigated in 1959 are counted as irrigated farms.

Land in Irrigated Farms.-Data for land in irrigated farms according lo use relate to the entire acreage in these farms, including land that was not irrigated.
Land Irrigated.-Data for land irrigated relate only to that part of the land in irrigated farms that was watered by artificial means at any time in 1959. Separate figures are given for farms reporting land irrigated by sprinklers whether or not the land was also irrigated by other means. Additional figures are given for farms reporting land irrigated by spriuklers onls. Data on sprinkler irrigation were not obtained in the 1954 census.

Irrigated Cropland Harvested. -The data for irrigated cropland harvested relate to all irrigated land from which crops were harvested in 1959, regardless of the method of irrigation. An instruction on the questionnaire reminded enumerators and respondents to include irrigated land from which hay was cut, irrigated land in both bearing and nonbearing fruit and nut crops, and irrigated land from which volunteer crops were harvested. Each irrigated acre was to be reported onty once, regardless of how many crops were harvested from it.

Other Irrigated Land.-Thls classification was obtained by subtraction of the acreage of irrigated cropland harrested from the acreage of total land irrigated. It represents primarily irrigated croptand not harvested and irrigated pasture or grazing land.
Farms Irrigated By Number of Acres Irrigated.-All farms on which any land was irrigated in 1959 are classified according to the number of acres irrigated in county table 1a for the 17 Western States, Louisiana, and Hawaii. This classification is based on total land irrigated. Therefore, it includes not only the irrigated land from which crops were harvested but also all other irrigated land, regardless of use.
Land Irrigated By Source of Water.-The agriculture questionnaire contained a question as to what proportion of irrigated water used on the farm in 1959 was obtained from groundwater, surface-water, and irrigation-organization sources. Respondents were asked to report separately the percentage of
water ohtained from each source. The number of acres that were irrigated by water from each source or combination of sources was calculated during office processing operations by applying the percentages to the total land irrigated.

Ground-water sources relate to wells (pumped or flowing) and springs; surface-water sources relate to streams, lakes, reservoirs, and sewage and drainage ditches. For each of these sources, only water obtained by pumps or other works operated as part of the operator's own farm or as part of another single farm was to be included. Irrigation-organization sources relate to irrigation enterprises organized to supply water to a group of farms, regardless of how or where the enterprise obtained the water. The irrigation enterprise may be a legal organization or a group of farmers informally organized to operate a supply ditch or other works to provide water for their own farms.

## Land-Use Practices

Summary Information.-The 1959 data for land-use practices are estimates based on reports obtained from only a sample of farms. Comparable data are not presented for 1954 because questions about land-use practices were included on the 1954 questionnaire for only a limited number of states. The various land-use practices relate to methods for redncing soil erosion, either by improving the soil, controlling the run-off of water, or reducing the blowing of topsoil.

Cropland in Cover Crops.-The data relate to land on which cover crops were turned under for green manure in 1959 and which was then planted to another crop. The entire acreage of cover crops so used was to be reported even if the following crop failed.

Cropland Used for Grain or Row Crops Farmed on the Contour.This item relates to land on which grain or row crops were planted in level rows around the slope of a hill.

Land in Strip-Cropping Systems for Soil-Erosion Control.-Stripcropping was defined as the practice of alternating close-sown crops with strips or bands of row crops or of alternating either close-sown or row crops with bands of cultivated fallow land. The published data refer to the total acreage of all fields and tracts in which strip-cropping was practiced in 1959.

System of Terraces on Crop and Pasture Land.-This item relates to the acreage in ridgetype or channel-type terraces constructed on sloping cropland and pasturelaud.

## Livestock and Poultry

Inventorles.-Data for livestock and poultry on farms relate to the number on hand at the time of enumeration. All livestock and poultry, including those being kept or fed under contract, were to be enumerated on the farm or ranch where they were, regardless of who owned them. Livestock in transit from one grazing area to another or grazing in national forests, grazIng districts, open range, or on land used under permit were to be reported as being on the place where the person who had control over them had his headquarters.

The the of year at which livestock and poultry are enumerated affects the data. Therefore, the date of enumeration needs to be considered when totals for the various censuses are compared. Both the 1959 and the 1954 census data represent fall inventories. These censuses came at a time of large-scale movement of flocks and herds from one range to another, from ranch to feed lot, and from farm or rancl to market.

The censuses of $1020,1025,1935$, and 1945 were taken as of January 1 and those of 1980, 1940, and 1950, as of April 1. A count made in April varies considerably from one made in January. In most areas a large number of animals are born between January and April. A considerable number of older animals die or are sold during the same period. In the range States, along
with the change in season and grazing condition, sheep and cattle are moved from one locality or county to a nother. This movement may affect the comparability of data for countles and, in some cases, for States. The comparability of data by age has been affected also by cbanges in the questions from one census to another.

Milk Cows, Cows Milked, Milk Produced, and Butter.-Data on the number of milk cows, cows milked, and milked produced relate to the day preceding the enumeration. Data for butter churned were obtained only for 14 States and relate to the calendar week preceding the enumeration. The data for cows milked yesterday and milk produced yesterday are not given in this volume. These figures were obtaiued primarily to serve the needs of the U.S. Department of Agriculture in making monthly and annual estimates of milk production. These figures can be made available, at a small cost, to others who express an interest in them.

Whole Milk and Cream Sold.-Data for whole milk and cream sold relate to the entire year 1959 and are estimates based on reports obtalned for farms in the sample. All milk and cream sold from the farm (except quantities purchased from some other place and then resold) were to be included, regardless of who shared the receipts. The questionnaire provided three alternative units of measure for reporting the quantity of milk sold-pounds of milk, gallons of milk, and pounds of butterfat. The respondent was thus permitted to report quantity according to the unit of measure in which payment was received. In the State and county tables, the data for milk are given in the unit of measure most commonly used in the State. Pounds of butterfat were converted into gallons or pounds of whole milk on the basis of the average butterfat content of milk as shown by data furnished by the Agricultural Marketing Service of the U.S. Department of Agriculture.

Sows and Gilts Farrowing.-In the 1959 census, data were obtained for the number of litters farrowed between December 1 , 1958, and June 1, 1959, and from June 1 to December 1, 1959. In the 1954 census, data were obtained for the sows and gilts that farrowed rather than for the number of litters.

Sheep, Lambs, and Wool.-In the 1959 census, questions about sheep, lambs, and wool were asked in all States. Data on shearings and on amount of wool shorn were obtained for lambs and sheep separately. In the $\mathbf{1 0 5 4}$ census, sheep, and lamb inventories were not obtained for Florida, Georgia, and South Carolina.

Goats and Mohair.-In 1959, questions on goats, kids, and mohair appeared on the questionnaires for the following nine States: Arizona, Cahfornia, Missouri, Nevada, New Mexico, Oklahoma, Oregon, Texas, and Utah. In 1954, corresponding data were obtalned for Louisiana, New Mexico, Oklahoma, Oregon, Texas, Washington, and selected counties in Missourl.

Bees and Honey.-No questions on bees and honey were included on the questlonnaires for either the 1959 or the 1954 census. In 1959, however, enumerators were instructed to obtain agriculture questionnaires for places not having agricultural operations if they were engaged in beekeeping. The number of hives of bees and the amount of honey sold were to be reported in the "Remarks" space of the questionnaire. Data for bees and honey are not lncluded in this report.

Value of Livestock on Farms.-To ohtain the vatue of lirestock on farms, the number of each class of livestock or poultry on hand was multiplied by the State average price for 1959 , as furnished by the Agricultural Marketing Service of the U.S. Department of Agriculture. Comparable data for 1954 were compiled by the same method on the basis of average prices for that year.

Sales of Live Anlmals.-Data for the number and ralue of animals sold alive in 1959 are estimates hased on reports for sample farms only. Corresponding data for 1954 were oblained for all farms. The dollar value of sales was obtained from the farmer
for cattle, calves, and horses and mules. Average value per head for other hivestock sold was obtained from the U.S. Department of Agriculture. In the 1959 census, respondents were asked to report separately the number of live animals already sold and the number estimated to be sold between the time of enumeration and the end of the year. This separation of reports for the number sold and to be sold was designed to nssure more complete coverage of all livestock sales made during the year. In the $19 \overline{4} 4$ census, only totals for the entire year were obtained though reference was made to animals to be sold between enumeration and the end of the year.

Sales of Poultry and Poultry Products.-For both the 1959 and the 1954 Censuses, sales of chickens were obtained for two groups: (1) broilers and (2) other chickens. The enumeration of broiler sales presents prob'ems arising from the varied contractual arrangements under which broilers are produced. The questionnaire contained an instruction to the effect that all broilers grown for others under contract were to be reported as sold. During office processing operations, the data reported for inventories and sales of chickens four montbs old and over, chicken eggs sold, and broilers sold were carefully examined. Obvious inconsistencies indicating coufusion between broilers and other chickens were corrected on the basis of estimated values and, for sample farms, on the basis of data reported for expenditures for feed, poultry and livestock purchases, hired labor, etc.

Questions relating to pouitry other than chickens (and broilers) were generally the same in 1959 as in 1954. In the 1959 census, however, only total numbers were obtained for turkeys and turkey fryers raised and for turkey hens kept for breeding whereas the 1954 questionnaire asked for a breakdown between light and heavy breeds. Also, for poultry other than chickens and turkeys, the 1959 census obtained the number sold whereas the 1954 census obtained the number raised.

## Classification of Farms

Scope of Classification,-Data for land in farms, and for cropland harvested in farms classified by size, by color of operator and by tenure of operator were tabulated for all farms. However, most of the detailed data by size of farm, by color of operator, by tenure of operator, by economic class, and by type of farm are estimates based on farms in the sample. The farm classifications by size of farm, color of operator, tenure of operator, economic class of farm, and type of farm were made in the processing office on the basis of data reported on each questionnaire.
Farms by Size.-Farms were classified by size according to the total land area established for each farm. The same classification was used for all States. According to definition, a farm is essentially an operating unit, not an ownership tract. All land operated by one person or partnership represents one farm. In the case of a landlord who has assigned land to croppers or other tenants, the land assigned to each cropper or tenant is considered a separate farm even though the landlord may operate the entire landbolding as one unit in respect to supervision, equipment, rotation practice, purchase of supplies, or sale of products. In some parts of the South, a special Landlord-Tenant Questlonnaire was used to assure an accurate enumeration of each unit within a multiple-unit operation. A change was made in the size classification for 1959, as contrasted with several preceding years, by subdividing the 1,000 -acre-and-over group and by combining two previously recognized groups, viz., 10 to 29 acres and 30 to 49 acres.
Farms by Color of Operator.-Farms were classified by color of operator into two groups, "white" and "nonwhite." "Nonwhite" includes primarily Negro and Indian operators but aiso some of other raclal origin.

Enumerators were instructed to report the race on the basis of their own observation whenever possible rather than by asking the respondent.

Farms by Tenure of Operator.-The classification of farms by tenure of operator was based on data reported for land owned, land rented from others or worked por others on shares, land managed for others, and land rented to others or worked on shares by others. The same basis of classification was used in 1959 as in 1954.

For 1959, each questlonnaire was coded, during the editing process, to indicate whether it represented a farm operated by a full owner, part owner, mangger, or tenant. The sample questionnaires for temants were given a code to indicate the kind of tenant.

The various classifications of tenure, as used for the 1959 census, are defined below:
a. Full 0 wners operate only land they own.
i. Part Owners operate land they own and also land rented from others.
c. Managers operate land for others and are pail a wage or salnry for their services. I'ersons acting merely as caretakers or lired as laborers are not classified as mangers. If a farm operntor managed land for others and also operated land on his own account, the land operated on his own account was considered as one farm and the land managed for others as a second farm. If, however, he managed land for two or more employers, all the managed land was considered to be one farm.
d. Tenants rent from others or work on shares for others all the land they operate. They are further classified, as described below, on the basis of rental arrangements in regard to the payment of cash rent, sharing of crops, sharing of livestock or livestock products, and the furnishing of work power ly the landiord.
(1) Cash Tenants pay cash rent, either on a per-acre basis or for the farm as a whole.
(2) Share-Cash Tenants pay part of the rent in cash and part in a share of the crops and/or of the livestock and livestock products.
(3) Crop-Share Tenants pay a share of the crops but not of the livestock or livestock products.
(4) Livestock-Share Tenants pay a share of the livestock or iivestock products. They may or may not also pay a share of the crops.
(5) Croppers are tenants whose landlords furnished all the work anlmals or tractor power. They usually work under the close supervision of the landowners or their agents, or other farm operators. Also, the land assigned to them is often werely a part of a multi-unit operation. Croppers may or may not also pay cash rent or a share of crops, livestock, or livestock products. Data for croppers are available for only 16 southern States and Missouri.
(6) Other Tenants are those who did not qualify for inclusion in any of the foregoing subclassifications. They may have had the use of land rent-free or in return for a fixed quantity of products, payment of taxes, maintenance of buildings, etc.
(7) Unspecifled Tenants are those for whom the rental arrangement was not reported.
The definition of each subclass of tenant was essentially the same for earlier censuses as for 1959 . In 1945, however, the enumerator was asked to determine the subclass of tenants whereas in other censuses all classifications were made during the processing of questionnaires on the basis of the data reported. The procedure used in 1945 may have affected the comparabillty of the data, especlally for cash tenants and share-cash tenants.
Farms by Economic Class.-The totals for farms by economic class are estimates for all farms made on the basis of data reported only for the sample farms. The economic classifications represent groupings of farms that are slmilar in characteristics and size of operation. The economic classes were established on the basis of one or more of four factors: (1) total value of all farm products sold, (2) number of days the farm operator worked off the farm, (3) the age of the farm operator, and (4) the relationshly of income received by the operator and members of his household from wonfarm sources to the value of all farm products sold. Institutioual farms, Indian reservations, agricultural experiment stations, and grazing associations were always classified as "abnormal."

The total value of farm products sold was obtained by addition of the reported or estinated values for ath products sold from the farn. The value of cattle and calves, horses and mules, dairy products, some poultry products, vegetables, nursery and greenhouse products, standing timber, and miscetlaneous forest products was obtained from the Farm operator during the enumeration. The quantity sold was obtained during enumeration for corn, sorghums, small grains, hay, small fruits, some of the forest products, chickens and chicken eggs, hogs, sheep, and goats. To obtain the value of sales of these products, the quantity sold was multiplied by State average prices.

For each of the other products, the entire production was muttiplied by the State arerage price. If the resulting value amounted to $\$ 100$ or more, the entire quantity produced was considered as sold. This procedure was followed only in establishing the economic class and the type of farm but was not used in establishing the total value of products sold from the farm. (See p. XXV.)

Farms were grouped into two major categories, commerclal farms and other farms, mainly on the basis of total value of products sold. The 1959 class intervals and some of the criteria for determination of a giren ctass are different from those used in 1954 and in 1950. In general, for 1959, all farms with a value of sales amounting to $\$ 2,500$ or more were classifled as conmercial. Farms with a vatue of sales of $\$ 50$ to $\$ 2,499$ were classified as commercial if the farm operator was under 65 years of age and (1) be did not work off the farm 100 or more days during the year and (2) the incone received by the operator and members of his family from nonfarm sources was less than the value of all farm products sold. The remaining farms with a value of sales of $\$ 50$ to $\$ 2,499$ and institutional farms and Indian reservations were inctuded in one of the groups of "other farms."

Commercial farms were divided lnto six economic classes on the basis of the total value of alt farm products sold, as follows:

Class of Farm

Valuc of Farm
Products sold
$\$ 40,000$ and over
$\$ 20,000$ to $\$ 39,999$ $\$ 10,000$ to $\$ 19,999$ $\$ 5,000$ to $\$ 9,999$ $\$ 2,500$ to $\$ 4,999$
$\$ 50$ to $\$ 2,499$

* Protided the farm operator was under 65 years of age, and-
(1) he did not work off the farm 100 or more days, and (2) the income that he and members of his household recelved from nonfarm sources was less than the total value of farm products sold.
other farms were divided into three economic classes as follows:
a. Class VII, Part-tlme.-Farms with a value of sales of farm products of $\$: 0$ to $\$ 2,499$ were classified as "part-time" if the operator was under 65 years of age and he either worked off the farm 100 or more days or the income he and members of his household received from nonfarm sources was greater than the total value of farm products sold.
b. Class VIII, Part-retirement.-Farms with a value of sales of farm products of $\$ 50$ to $\$ 2,499$ were classified as "partretirement" if the farm operator was 65 years old or over. Many of these are farms on which the income from nonfarm sources was greater than the value of sates of agricultural products. Others are residential, subsistence, or marginal farms. In previous censuses, the age of the farm operator was not a eriterion for grouping farms by economic class. Since the number of elderly peopte in our population has been steadily increasing during recent years, a separate classiflcation for farms operated on a part-retirement basis was considered important for an adequate analysis of the agricultural structure of a county or State.
c. Class IX, Abnormal.- All institutional farms and Indian reservations were classified as "abnormak," regardless of the value of sales. Institutional farms include those operated
by hospitals, penitentiarles, schools, grazlng assoclatlons, government agencies, etc.
Farms by Type.-The data for farms by type are estimates based on data tabulated for the farms ln the sample. The type represents a description of the major source of income from farm sales. To be classified as a particular type, a farm had to have sates of a particular product or group of products amounting In value to 50 percent or more of the total value of all farm prodnets sold during the year.

The types of farms, together with the products on which type classification is based, are as follows:

| Tupe of Farm | Source of Cash Income |
| :---: | :---: |
|  | (Products with sales value representing $50 \%$ or more of total value of all farm products sold) |
| Cash-graiu $\qquad$ Corn, sorghums, small grains, sofbeans for beans, cowpeas for peas, dry field and seed beans and peas. |  |
| Tobacco | Tobacco. |
| Cotton | Cotton. |
| Other field-crop | Peanuts, potatoes (Irish and sweet), sugarcane for sugar or sirup, sweet sorghums for sirup, broomcorn, popcorn, sugar beets, mlnt, hops and sugar beet seed. |
| Vegetable | Vegetables. |
| Fruit-and-nut | Berries, other small fruits, tree frults, grapes, and nuts. |
| Poultry | Chickens, chicken eggs, turkeys, and other poultry products. |
| Dajry | Milk and cream. The criterion of 50 percent of total sales was modified in the case of dairy farms. A farm having value of sales of dairy products amounting to less than 50 percent of the totat value of farm products sold was classified as a dairy farm, if- |
|  | (a) Milk and cream sold accounted for more than 30 percent of the total value of products sold and- |
|  | (b) Miik cows represented 50 percent or more of total cows and- |
|  | (c) The value of milk and cream sold plus the value of cattle and calves sold amounted to 50 percent or more of the total value of all farm products sold. |

Lirestock other than
dairy and poultry_...... Cattle, calves, hogs, sheep, goats, wool and mohair except for farms in the 17 Western States, Louisiana, and Florida that qualified as livestock ranches.
Livestock Ranches__._ Farms in the 17 Western States, Louislana, and Florida were classified as livestock ranches if the sates of livestock, wool, and mohair represented 50 percent or more of the total vatue of farm products sold and if pastureland or grazing land amounted to 100 or more acres and was 10 or more times the acreage of cropland harvested.
General_------------.. Fleld seed crops, hay, sllage. A farm was classified as general also if it had cash income from three or more sources and did not meet the eriteria for any other type.
Mlscellancous....................... products, mules, horses, colts and ponies. Also all lustitutional farms and Indian reservations.

The type classifications were essentially the same for the 1950 as for the $10 \mathrm{a}+\mathrm{census}$ except that tobatco farms and livestork ranches were not separately classitied in $19-4$. Tobaceo was incluted as one of the crops used in the classification of "other field croy" farms in lo.f. The farms classified as livestock ranches in 19 as? would have been classified as "livestock other than dairy and poultry" in $19 \% 4$ withont regard to the acreage in pasture.

Value of Farm Products Sold.-Data for the value of farm products sold in 1959 were obtained by enmmeration fur some products and bs estimation for others. Tho questionnaire used for the 1959 census provided for farm operators to report value of sales for the following products:
Vegetables Miscellaneous poultry products Nursery and greenhouse prod- Milk and cream

Cattle
Standing timber
Calves
Horses, mules, colls, and ponies
For all other agricultural products, the value of sales was estimated during the office processing. The State arerage brices used for calculating the value of farm products sold were furnished to the Bureau by the Agricultural Marketing Service of the U.S. Department of Agriculture. One of three following procedures was used.
(1) For the products for which data on quantities sold were obtained during enumeration, the State average prices were multiplied by the county totals of the quantities reporled as sold or the quantities reported as produced for sale. The following prodncts were conered by this procedure:

| Corn for grain | Fence posts |
| :--- | :--- |
| Sorghums for grain, seed, sirup, | Sawlogs and veneer logs |
| or dry forage | Christmas trees |
| All small grains | Chickens (broilers and others) |
| Hay crops | Chicken eggs |
| All berries and small fruits ${ }^{1}$ | Hogs and pigs |
| Firewood and fuelwood | Sheep and lambs |
| Pulpwood | Goats aud kids |
| $\quad{ }^{1}$ Adjustment made for cranberries based on Cranberry Payment |  |
| Program. |  |

(2) For most of the agricultural products which are customarily raised for sale, the entire quantity produced was considered to be sold. The State average prices were, accordingly, multiplied by the county total of production. The following crops were covered by this procedure :

Cotton
sugarcane for sugar
lopeorn
singar beets for sugar
Brooncorn

Tobaceo
Wool
Mohair
(3) For all other ropos, the State average prices were nul tiplied by the quantities sold as estimated on the basis of conpdisposition data furnished by the Agricultural Marketing Service, data reported in questions for "other crops" on the 1959 questionnaire, or data obtained from earlier censuses.

For all tree fruits, nuts, and grapes, the entire quantity produced was considcred as sold, excent for apples, apricots, sum and sweet cherries, peaches, flums, frunes, avocados, tangerines, orances, and gratefruit in states where a portion of the crop was not harvestral or was subjerted to excess cullage as indicated by data obtained from the Agricultural Marketing Service of the U.S. Department of Agriculture.
The data for 1054 are combarable with those for 1954 since essentially the same procedures were used in both censuses for estimating quantities and values of farm products sold. In 1959, as in 1954 , data for the sales of farm products represent total sales for the entire farm, regardless of who shared the receipts. For tenant-operated farms, the landlord's share of agricultural products was considered as sold provided the products were moved off the tenant farm. All crops, livestock, and poultry raised under a contract arrangement were considered as sold from the farm where they were raised, For institutional farms, all agricultural items produced on land operated by the institution and consmmed by the immates were to be reported as sold.

All sales data relate to one year's farm operations. Cropsales are for crops harvested during the crop year, whether the crops were actually sold immediately after harvest or placed in storage for later sale. Sales of livestock and livestock products relate to the calendar year, regardless of when the livestock or produets were raised or produced. All wool and mohair reported as shorn or clipped was considered as sold.

Enumerators were instructed to record gross values of quantities sold, with no dednctions for feed, seed, fertilizer, water, labor, or marketing costs. For some products, however, net values may have been reported. In the case of milk, particularly, some farm operators may have reported the payments they received as the gross value of sales, even though the buyer had deducted handing and hauling charges before making payment. Adjustments were made in the data reported only in cases of obvious error.

## Chapter A

## STATISTICS FOR THE STATE

NA Not available.
${ }^{1}$ Excludes data for farms unciassified as to type.
${ }^{2}$ Trees, plants, vines, etc., in nurseries; flower and vegetable seeds; and bulbs.
${ }^{\text {Prews, }}$ plants, and flowering plants grown for sale.
${ }^{4}$ Crowers and frown under gless (flowers, plants, and vegetables) and propagated mushrooms.
$\mathrm{s}_{\text {Flowers, }}$ plants, and vegetables grown under glass; and flowers grom in the open.
${ }^{6}$ Total square feet under glass.
${ }^{7}$ Flower and vegetable seeds, bulbs, and flowers and plants grown in the open
$\mathrm{V}_{\mathrm{Val}} \mathrm{lue}$ of illower and vegetabie seeds; and vegetables and vegetable plants.
${ }^{9}$ Not strictly comparable with other years as figures probably include some reports of firewood used on farms.
${ }^{20}$ Figures include sales of standing timber.

U.S. Bureau of the Census. U.S. Census of Agriculture: 1959. Vol. I, Counties, Part 29 Florida
U.S. Government Printing Office, Washington, D.C., 1961

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington 25, D.C., or any of the Field Offices of the Department of Commerce. Price $\$ 1.50$

## PREFACE

Volume I, Counties, is one of the five principal reports presenting the results of the 1959 Ceusus of Agriculture. This volume, in 54 parts, presents the compilation of the information given by farm operators to census enumerators in 1959.

The 1959 Census of Agriculture was taken in conformity with the Act of Congress of August 31, 1954 (amended August 1957), which codified Title 13, United States Code.

The collection of the data was carried out by census enumerators directed by superrisors appointed by the Director of the Bureata of the Census and working under the direction of Robert 13. Voight, then Chief, Field Division. Paul R. Squires, then Special Assistant to the Director, was responsible for the recruitment of the field staff. The plaming of the census and the compilation of the statistics were supervised by Ray Hurley, Chief, Agriculture Division, Warder 13. Jenkins, Assistant Chief, and Orvin L. Wilhite, Assistant Chief. They were assisted by M. Vincent Lindquist, Thomas Jabine, Robert S. McCauley, John C. Mackey, Robert Standley, Hilton E. Rohison, Melen F. Teir, Carl R. Nyman, Kenneth R. Norell, Gladys L. Eagle, Henry L. DeGraff, Charles II. Boehne, Joseph A. Correll, Margaret G. Wood, Evelyn K. Jett, Simon Yablon, Emma B. Gass, Charlotte J. Nessinese, Bennie L. Sharp, Isaac E. Lemon, James M. Lindsey, Samuel S. Murray, William F. Kauffman, Hector Vila, Harry P. Owings, Charles A. Nicholls, Henry A. Tucker, Robert S. Boyle, IIelen M. Davenport, Albert IV. Graybill, Lois G. Miller, Thomas D. Monroe, Gerald P. Owens, Bernard L. Ross, Marvin M. Thompson, Helen D. Turner, Kurt W. Laethy, Arnold L. Bollenbacher, George W. Coffman, Joseph A. Horak, Samuel J. Hundley, Donald K. Larson, Chester G. Lykins, Wilmer R. Maxham, Virgil L. McClain, Jr., Darrell D. Prochaska, Robert J. Rades, Hubert E. Sites, Duane E. Traylor, Donald II. von Steen, Elmer O. Rea, Frances G. Compton, Lillian W. Bentel, and Neil V. Perkins.

Acknowledgment is made of the technical assistance and the loan of personnel by the United States Department of Agriculture in the planning, the enumeration, and the compilation of the 1959 Census of Agriculture.

## UNITED STATES CENSUS OF AGRICULTURE: 1959 <br> FINAL REPORTS

Volume I-Counties-A separate part for cach State. Statistics on number of farms; farm characteristics; acreage in farms; cropland and other uses of land; land-use practices; irrigation; farm facilities and equipment; farm labor; farm expenditures; use of commercial fertilizer; number and kind of livestock; acres and production of crops; value of farm products; characteristics of commercial farms, farms classified by tenure, by size, type, and economic elass; and comparative data from the 1954 Census of Agriculture.

Volume I is published in 54 parts as follows:

| Part | State or States | Part | State or States | Part | State or States |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | New England States: <br> Maine | 19 | West North Central-Continued | 38 | Mountain: |

| 13 | Michigan. | 31 | Tennessee. |  | Other Areas: |
| 14 | Wisconsin. | 32 | Alabama. | 51 | American Samoa. |
|  | West North Central: | 33 | Mississippi. | 52 | Guam. |
| 15 | Minnesota. |  | West South Central: | 53 | Puerto Rico. |
| 16 | Iowa. | 34 | Arkansas. | 54 | Virgin Islands. |
| 17 | Missouri. | 35 | Louisiana. |  |  |
| 18 | North Dakota. | 36 37 | Oklahoma. <br> Texas |  |  |
|  |  | 37 | Texas. |  |  |

Volume II-General Report.-Statistics by Subjects, United States Census of Agriculture, 1959. Summary data and analyses of the data by States, for geographic divisions, and for the United States, by subjects, as illustrated by the chapter titles listed below:

| Chapter | Title | Chapter | Title |
| :---: | :---: | :---: | :---: |
| I | Farms and Land in Farms. | VII | Field Crops and Vegetables. |
| II | Age, Residence, Years on Farm, Work Off Farm. | VIII | Fruits and Nuts, Horticultural Specialties, Forest Prod- |
| III | Farm Facilities, Farm Equipment. |  | ucts. |
| IV | Farm Labor, Use of Fertilizer, Farm Expenditures, and Cash Rent. | IX | Value of Farm Products. <br> Color, Race, and Tenure of Farm Operator. |
| V | Size of Farm. | XI | Economic Class of Farm. |
| VI | Livestock and Livestock Products. | XII | Type of Farm. |

Volume III-Irrigation of Agricultural Lands. Western States (Dry Areas) - Data by States for drainage basins and a summary for the area, including number and types of irrigation organizations, source of water, expenditures for works and equipment since 1950, water used and acres served for irrigation purposes.

Volume IV-Drainage of Agricultural Lands. Data by States on land in drainage organizations, number and types of organizations, cost of drainage and drainage works.

Volume V-Special Reports, Part 1.-Horticultaral Specialties. Statistics by"States and a summary for the United States presenting number and kinds of operations; gross reccipts and/or gross sales; sales of nursery products, flower seed, vegetables grown under glass, and propagated mushrooms; number of containergrown plants; inventory products; sales of bulb crops; employment; structures and equipment.

Titles of additional parts of this volume are not available as this report goes to press.

# INTRODUCTION 

## THE 1959 CENSUS OF AGRICULTURE

History of the Census.-The 1959 Census is the 17 th nationwide agricultural census. The first agricultural census was taken in 1840, at the same time as the Sixth Decennial Census of Population. From 1850 to 1920 , an agricultural census was taken every 10 years. With inereased apptication of scientific findings and the growing use of mechanization in agriculture, farming practices were changing su rapidly that facts collected at 10 -year intervals were no longer adequate. Aware of the need for more accurate and timelr information, the Congress in 1909 (36 stat. 10, sec. 31 , provided for a census to be takan in 1915 and every 10 rears thereafter which was to tie in addition to the census of agriculture to be taken at the time of the decennial census of population. The 1915 census was not taken, however, because of the abnormal conditions created bs World War I. Beginning with 1920, a national agricultural census has been taken every 5 years.
Legal Basis for the Census.-The 19\%9 Census of Agriculture was authorized hs an Act of Congress, as were all prior censuses of agriculture. "Title 13, United States Code-Census," codified in August 19.4, and amended in August 19.56 and Spptember 1960, is now the legat basis for censuses of agriculture and other censuses, and survers conducted by the Rureau of the Census. Section 142, paragraph (a), of Title 13 makes provision for the Census of Agriculture. It reads as follows:

#### Abstract

"The Secretary shatl, heginning in the montl of October 1959, and in the same month of every fifth jear thereafter, take a census of agriculture, provided that the censuses directed to be taken in October 1959 and each tenth rear thereafter, mas. when and where deemed advisable hy the Secretary, be taken instead in conjunction with the ceususes provided in section 141 of this title." (Section 141 relates to the decennial censuses of population, unemployment, and housing to be taken as of the first day of April of each decennial Jear.) Under authorits granted by Section 4 of Title 13, the Secretary of Commerce delegated "the functions and duties imposed unon him by this title" to the Director of the Burean of the Census.

Pretest of the 1959 Census.-A "pretest" of the fietd procedures of the 1959 Census of Agriculture was conducted in 17 connties of the linited States during the fall of 1958 . The purpose of the pretest was to provide the Bureau with a measure of the effectiveness of the questions and procedures planned for the 1959 nationwide census. Three versions of the agricmlture question-naire-the first one for Northern States, the second for Southern States, and the third for Western States-were used in the pretest. Each rersion contained questions appropriate to the type of agriculture in the part of the country where it was used. All major aspects of field forms and procedures, from the hiring and training of crew leaders and enumerators to actual interviews with farm operators, were given a "trial run" in each of the 17 counties. Preliminary versions of reporting forins, maps, payroll records, training guides, and instruction manuals were subjected to actual use under conditious simulating those expected in the nationwide enumeration conducted in the fall of 1959.

In making final preparations for the 1959 census, the staff of the Bureau drew heavily on the results of the pretest, as well as on experience gained from previous censuses.

Training Program for Personnel for Enumeration.-Every person hired to do work in connection with the 1959 Census of Agriculture received specialized training for his job. Staff mem-
bers oi the Washington and Regional Offices of the Bureau and of the U.S. Department of Agriculture trained approximatels 110 agriculture field assistants and 2,100 crew leaders. The crew leaders. in turn, trained and supervised approximately 30,000 enumerators. All training was presented according to procedures contained in various guides and manuals prepared by the Lureau. The training program included filmstrips, map-reading, practice interviewing, and practice flling of questionnaires and other census forms. In most instances, training sessions were held near the areas in which emplogees worked and immediately prior to the beginning of their assignments.

Enumeration Pertod.-The actual enumeration in the cunterminous United States (see page XIV) started at dates rarring from October 7 to November 1S, 1959. In gemeral, starting dates were based upon regional variations in harvesting seasons and on weather conditions. The primary aim was to fase the enumeration late enough to fotlow the hareesting of the bulk of important crops and early enoush to foreeds the adrent of winter weather with the attending niffavorable travel comlitions. The bulk of the enumeration work was conpteted within three to four weeks after the starting date. In Ilawaii, the emmeration was made during the months of Decenber 1359 and January 1960 ; and in Alaska, during April 1960.

Enumeration starting dates for the censuses of 1959 and 1954 are given in State table II, together with figures showing the percentage of farms enumerated in the State during weekly periods. The average eummeration date for the Idas) census for each connts is given in county tatile 6 .

Data for inventory items-land in farms, machinery and equipment, livestock, and poultry-relate to the situation at the artual time of enumeration of each inlividual farm. Data for acres, productiou, and sales of crops relute generalty to the crops harvested during the crop year 1958, remardless of whethou and when they were sold while dats fur sase of lifestock and livtstork products relate to the calendar sear 1950 . Since the emmeration was made before the end of $100 \square$, special emplasi.s w: * placed upon the inclusion of estimates for rrops yet to le sold and for livestock and livestock protucts experted to le subl in the feriod from the time of enmmeration to the ond of the calendar year. Instructions on the questionnaire amd the wording of questions were designed to assure that full cror-year or calendar-year data would be reported. For example, "IIow much of this year's crop was or will be sold?"

## ENUMERATION FORMS AND PROCEDURES

Authorization.-Section 5 of Title 13 of the United States Code authorizes the preparation of forms and questionnaires used ln the census. It reads as follows:
"The Secretary shall prepare schedules, and shall determine the inquiries, and the number, form, and subdivislons thereof, for the statistics, surveys, and censuses provided for in this title."
The Agriculture Questionnalre. The questionnaire for the 1959 Census of Agriculture was prepared by the staff of the Bureau. Selection of the inquiries was based on the results of the 1958 pretest and experience gained in earlier censuses. Careful consideration was given to such factors as the current availability
of data from other sources, the possibilits of obtaining aata by methods other than a census, the adequacy of the data that might be obtained, and the need fur and usetuluess of the data. Two committees gave alvice and comsel to the Burean one of these, a Special Advisory Committee, was compused of members designated by the organizations they represented, following an invitation from the Director of the bureau of the Census to name a representative to serve in an advisory capacity. The special Advisory Committee for the 1459 Census of Agriculture was made up of one representative from each of the following: Agricultural Publishers Association, American Association of LandGrant Colleges and State Liniversities, American Farm Bureau Federation, American Farm Efonomic Ascociation, American Statistical Association, Farm Equipment lustitute, National Association of Commissioners, Secretaries, and Directors of Agriculture, National Council of Farmer ('onperatives, National Farmers" Union, National Grange Rural Suciological Societs, and the L.S. Bepartment of Agriculture. A representative of the Bureau of the Budget was in attendance at all meetings of the Advisory Committee.

Because of the special interest of the ['.S. Department of Agriculture in censuses of agriculture, the bitcetor of the Bureatu of the Census sought the continuous cooperition of that organization in dereloping plans, questionnaires, and procedures for the 1:559 Census of Agriculture. Working Groups were established in the U.S. Department of Agriculture to make recommendatious for the following general subjects:

```
Tenure, Land Values, and Mortgage Debt
Land Use and Conservation and Production Practices
Field Crons
Fruits and Vegetables
Furest lroducts
Livestock, Poultry, and Dairy
Income and lxpendithre (including Contractual Operations)
Farm Labor
Equipment and Facilities (includines Structures)
```

Each Working Group latl the responsibitity for ascertaining the U.S. Department of Agriculture's need for data in the field cosered by its "terms of reference" and for presenting recommendations to a small Joint Committee comprising representatives of both the Bureau of the Census and the U.S. Department of Agriculture. The Joint Committee receised written recommendations from each Working Group. The Chairman of each Group appeared before the Joint Committee as did any member of the Working Group who was needed to present supplemental information of a specialized nature.

Prior to the formulation of the questionnaire. State Agricultural Colleges and other major users of census data were inrited to suggest inquiries for the enumeration. Each member of the Special Advisory Committee had the opportunity and the responsibility for channeling in suggestions from the organization he representeri. The number of inquiries submitted from all sources greatly exceeded the number that could be included ln the census, from the point of view of cost, of the respondent's time and patience, and of practical value to the majority of users of data.

The final selection included 316 questions, some of which consisted of seseral parts, for the 48 States comprising the conterminous United States. Although each of the 356 questions was asked in one or more of the 48 States, considerably less than this total was asked in any one State because of the use of "State" questionnaires. Moreorer, about 50 questions out of the total were asked of apmroximately one-fifth of all farm operators in the State. The number of questions ranged from 159 on the questionnalre for Maine to 194 on the questionnaire for Callfornia. In all, 38 verslons of the questionnaire one for each State or combination of adjoining States and two for Texas-
were used for the 1959 census in the conterminous United States as comtsared with 21 versions in 1954 and 41 in $16 \%$. A separate rersion was used in Alaska and another in Hawaii.

Differences in the questionnaires were designed to account for regional and local differences io agriculture. Most, but not all, of the differences related to crops. The use of State questionnaires made possible the inclusion of separate inquiries for all important crops grown within a state and, at the same time, a reduction in the total number of inquiries for a State. Questions that did not apply, to any considerable degree, to a particular State were omitted from the questionnaire used in that state. For example, separate questions about citrus fruits were omitted from all questionnaires excent for the few States where citrus fruits are grown. An added advantage of State questionnaires was that production and sales data could be asked in the unit of measure most commonly used by the farmers in each State. Regional variation in the number and type of questions is an important provision of the census for obtaining complete coverage of agricultural operations.

About 2 wecks before the start of the enumeration, agriculture questionnaires were mailed to most households in rural areas. A letter was attached to each questionnaire asking the farm operator to fill the questionnaire and to give it to the enumerator when he called. The purpose of this procedure was to sare time and money in taking the census and to improve the quality of the information given by farm operators. By having the questionnaire ahead of time, the farmer could determine what information would be required and could check his records in advance of the enumerator's visit. It was, howerer, the responsibility of the enumerator to obtain an agriculture questionnaire for eath plare which qualified. If the questionnaire had been filled out by the farm operator, the emmerator was instructed to examine the questionnaire for completeness and accuracy and, if need be, to give the farmer such help as might be necessary.

Agricultural Operations.-The training of enumerators stressed the concent that a census of agriculture is a census of agricultural operations rather than a census of farms. This concent was inteuded to assure a complete agricultural census free of any personal judgment by enumerators as to what constitutes a farm. In accordance with clearly defined procedures, an enumerator was required to obtain an agriculture questionnaire for each person who had charge of one or more agricultural operations, whether or not he considered himself to be a farm operator. For enumeration purposes, it was considered that there were agricultural operations on a place if, at any time in $1959-$
a. Any livestock (bogs, cattle, sheep, goats, horses, or mules) were kent on the place.
b. A combined total of 20 or more chickens, turkeys, and ducks were kept on the place.
c. Any grain, hay, tobacco, or other field crops were grown on the place.
d. A combined total of 20 or more frult trees, grapevioes, and nut trees were on the place.
e. Any regetables, berries, or nursery or greenhouse products were grown on the place for sale.
As a result of the requirement that all places having agricultural operations be enumerated, more questionnaires were obtained than are lncluded in the tabulations for farms. During the office processing operations that followed the completion of enumeration, criteria were applied to the questionnaires to sort out for tabulation those that represented farms according to the census definition of a farm (see page XIV).

Enumeration Assignments and Enumeration Districts.-To assure a complete enumeration within the tlme allotted, the United States (excluding Alaska and Hawaii) was divided into 29,374 Enumeration Assignments, or EA's. Each EA comprised an
area that one enumerator conld reasonably be expected to canvass within a 3 - to 4 -week period, as indicated by performance records from the 1 !ht cemsus.

Each EA was wade up of one or more Enumeration Districts, or "ED's," as the geographic unit for enmmeration. Prior to the euumeration, the ED's were classified into three groups on the basis of the density of dwellings in relation to the number of farms, as indicated by the 1954 Census of Agriculture, the 1950 Census of I'opulation and Housing, current population estimates, and highway maps showing culture which were basic to establishing the houndaries of each assignment. Through the use of different cauvassing procedures for each group of ED's, the Bureau was able to reduce the cost of enumeration without running any material risk of missing any farms or other places with agricultural operations. The ED groupings and canvassing procedures are described below.

Group I Enumeration Districts.-In general. ED's with no well-defined cluster of dwellings were considered to be opencountry areas and comprise Group I. For each ED of Group I, in his Enumeration Assignment, the enumerator was required to list in his Record Book the name of every head of bousehold living in the ED and also the name of erery person not living in the ED who had agricultural operations there. There were approximately $20,7 \pi 1$ ED's in Group I for the 1959 Census.

Group II Enumeration Districts.-Rural ED's in which the number of dwellings was large in relation to the number of farms were considered to be in Group II. For each ED, in Group II, the enumerator was required to list the head of the bousebold for all dwellings in the ED except for those on less than one acre of ground in built-up residential areas of 50 or more dwellings. He was also required to determine, by observation or local inquiry, whether there were any farms or other places with agricultural operations in the built-up areas and, if so, to obtain an agriculture questionnaire. There were approximately 7,979 ED's in Group II.

Gronp III Enumeration Districts.-Most incorporated places and unincorporated villages having approximately 150 or more dwellings were designated as separate ED's and are classified as Group III. Also, most ED's in counties around large metropolitan areas were designated as Group III Ed's. Prlor to the 1959 Census of Agriculture, places enumerated in these areas during the 1954 Census of Agriculture were listed in the Enumerator's Record Book. The enumerator was required to visit and enmmerate or otherwise account for each place listed in his Record Book. In addition, he was instructed to ask at each of these places if there were any farms or other places with agricultural operations in the Enumeration District, and, if so, to add them to his list and enumerate them. There were approximately 15,836 Group III ED's in 1959 . According to the 1954 Census, these ED's contained 380,575 farms.
A few enumeration districts that comprised incorporated places or that were within an incorporated city were classified as Group I or Group II becanse they had a large number of farms. A few others, comprising extensive rural districts requiring considerable travel, were classified as Group 111 because they had only a small number of farms.

Enumerator's Record Book.-Each enumerator received one or more Record Books containing a listing form for use during caurassing. (See appendix for facsimlle of one page of listing form included in Enumerator's Record Book.) The innes on the listing form were numbered in consecutive order. Except as otherwise prescribed for Group II and Group III ED's, the enumerator fisted in his Record Book the name of each head of household living in his assigned area and also the name of each person not living in his area who had agricultural operations there. As he made his listlng, he also asked the questions about agricultural operations that were printed on the listing form. Answers to these questions determined, for the enumerator, whether or not an agriculture questionnaire was required for the person listed and, if so, whether he or some other enumerator was responsible for getting it. Thus, the Record Book served as an important aid to the enumerator in securing complete corerage of all agricuitural operations within his area. At the same
time, lt helped to prevent enumeration of the same place by two or more enumerators.

Enumeration Maps.-As a second aid to getting complete coverage, each enumerator recelved a map or, in a few exceptional cases, a brief written description of the area assigned to him for enumeration. He was required to plan and follow an orderls route of enumeration within the boundaries of his assigned area in accordance with established canvassing procedures. As the enumerator listed a place in hls Record Book, he indicated its location by coming onto his map the number of the line on which he listed it. This numbering system indicated the enumerator's route of travel, and helped both the enumerator and his crew leader to determine the extent of corerage of the enumerator's assignment at any giventime.

Lists of Special and Large Farms,-Prior to the enumeration, a card list of "special and large farms" was prepared on the basis of records obtained from the 1954 census and from Federal and State agricultural agencies. In general, "special and large farms" fell into one of three categories: (1) farms having unusually large acreages, lirestock inventorles, or annual sales as indicated by arailable records; (2) farms known to be specializing In such operations as broiler production, turkey growing, feed lots, nursery or greenhouse production, cranberry bogs, citrus groves, ete.; (3) farms that might easily be overlooked because they bad absentee operators or were not locally thought of as farms, such as institutions, Indian reservations, grazing associations, etc.

Enumerators were given the cards for the special and large farms within their assigmment areas to use as aids to obtaining complete coverage. Generally, the cards prorided insurance agalnst the omission of farming units that could hare a significant effect on the totals for a giren county or Siate. The enumerator was instructed to obtain an agriculture questionnaire for each special or large farm in his area or to write an explanation on the card as to why an agriculture questlonnaire was not required on the basis of 1959 operations. The crew leader had a duplicate set of cards for use in checking enumeration corerage.

Landlord-Tenant Questionnaire.-As in several previous censuses, a special landlord-tenant questionnaire was used in some parts of the South as a supplement to the agriculture questionnaire. Its jurpose was to help the enumerator get complete and accurate coverage of individually operated tracts of land that were actually part of one operating unit under the control of one landlord. To accomplish this purpose, the enumerator was required to fill a landlord-tenant questionnaire for each-iandlord who had any land worked on shares. The entries made in this questlonnaire included the name of each sharecropper, tenant, or renter; the amount of land assigned to each; and the acreage and quantity of crops harrested on shares. By checking these entries agalnst the agriculture questionnaires obtained for the indiridual operators, the enumerator and the Central Offce could verify that each part of the operating unit controlled by the landlord was enumerated and that it was enumerated only once. The landlordtenant questiennaire was used in 386 counties in the 1959 census as compared with approximately 900 counties in 1954.

Township Sketch Map.-In some areas of the Great Plains, a considerable portion of land ls farmed by nonresldent operatorsthat is, by persons who do not live on the land they operate or who live on it only during part of the year. Enumerators in these areas used a speclal mapping form, the Townshlp Sketch, in addition to their enumeration maps as an ald to obtalning comlete coverage. Each township included on the sketch was identlfied by township and range number and was divided into 144 small squares. In a standard section of 640 acres, each square represented a quarter section of land, or 160 acres. As the enumerator canvassed his assignment area, he indlcated the acreage and location of each farm, ranch, and tract of nonfarm
land by drawing its boundaries on the sketch. He also used a simple numbering system as a cross reference between the agricultural land identified on the sketch and the questionnaire on which it was reported. The Township Sketch was used in all counties of North Dakota and South Dakota and in selected counties of Colorado, Kansas, Minnesota, Montana, Nebraska, New Mexico, Oktahoma, and Wyoming.

Field Review of Enumerator's Work.-In the 1959 census, greater emphasis was placed on a detailed review of enumerators' work during enumeration than had been the case in previous censuses. The objective was to detect and correct enumeration errors as early as possible in order to achieve and maintain a high quality of individual ferformance. Starting on the first day of enumeration and continuing throughout the enumeration period, each crew leader was instructed to make regular and frequent visits to his enumerators. At each visit, he was to follow a clearly defined procedure for observing the enumerator's conduct of interviews and for checking bis listings, maps, questionnalres, and other forms for accuracy and completeness.

As an aid to checking coverage and enumerator efficiency, the crew leader was given a list containing estlmates, based on the 19.4 census, of the number of questionnaires required in each enumeration assignment area within his distrlct, and of the mileage and time required to obtain those questionnaires.

## SAMPLING

Use of Sampling. - In the 1959 census, as in several previous censuses, sampling was used in two ways: for enumeration and for tabulation. strmpling in enumeration consisted of the collection of information about the items included in sections IX through XV of the questionnaire for only a sample of farms. The "sample" items relate to sales ref dairy products and sales of livestock, use of fertilizer and lime, farm expenditures, iand-use practices, farm labor, equipment and facilities, rental agreements, farm values, and farm mortgage debt. The same sample of farms was used for tabletions by type of farm and by economic class of farm and cor many of those by size of farm and by color and tenure of operator.

Description of the Sample.-The sample used for the 1959 Census of Agriculture consisted of all farms with a total area of 1,000 or more acres or with estimated sales of $\$ 100,000$ or more in 1959 , and approximately 20 percent of all other farms. Farms with 1,000 or more acres were universally included in the sample during enumeration. As the enumerator filled the questionnaire, he determined the number of "acres in this place" (see question 7 of the agriculture questionnaire). If the acreage amounted to $J,(1) 0$ or more be was required to fill sections IX through XV of the questionnaire. Farms with less than 1,000 acres, with estimated sales of $\$ 100,000$ or more, were included in the sample during the office processing. For these farms the information for sectlons IX through XV was obtained by mail.

The selection of farms of less than 1,000 acres for lnclusion in the sample was made during enumeration, according to the following procedure: As the enumerator determined that he was required to obtain a questionnaire, he assigned a number to it, whether or not he was able to obtain the questionnaire on his first visit. He assigned numbers in consecutive order, beginning with " 1 " for the first questionnalre required in each enumeratlon distrlct within his area. He was instructed to fill sections IX through XV on all questionnaires for which the assigned number ended in " 2 " or " 7 " (1.e. 2, 7, 12, 17, 22, etc.).

Adjustment of the Sample.-An adjustment in the part of the sample that was comprlsed of farms of less than 1,000 acres :nd whth estimated sales of less than $\$ 100,000$ was made by a process essentlally equivalent to stratifylng the farms ln the sample by
size of farm. The purpose of this adjustment was to improve the reliability of the estimates based on the sample and to reduce the effects of possible biases introduced by enumerators who deviated from the prescribed pacedure for selecting the sample farms. The adjustment procedure was carried out for "blocks" of counties, each consistlng of from one to ten counties In a State. To adjust the sample, separate counts were made for each county, and for the block of counties of all farms and of farms in the sample for each of 10 size-of-farm groups based on the "acres in this place" (question 7). The 10 size-of-iarm groups were as follows: under 10 acres, 10 to 49 acres, 50 to 69 acres, 70 to 99 acres, 100 to 139 acres, 140 to 179 acres, 180 to 219 acres, 220 to 259 acres, 260 to 496 acres, and 500 to 909 acres. Farms of less than 1,000 acres, but with value of sales of $\$ 100,000$ or more, were excluded from these counts. For each size-of-farm group, the number of farms in the sample for the block of counties was adjusted to make it equal or approximately equal to the totai number of farms divided by five. This was accomplished for each group by the elimination or duplication on a random basls, of farms in those countles where the dlfference between the actual proportion in the sample and the expected 20 percent was in the same direction as the difference for the block of countles.

Estimation of Totals for the Sample.-For the items Included in the sample part of the questionnaire (sectlons IX tbrough XV), estimated totals for all farms were derived from the tabulated totals for the farms in the adjusted sample. Flrst, item-byltem totals, as tabulated for that part of the sample comprising farms of less than 1,000 acres and with estimated sales of less than $\$ 100,000$, were multiplied by 5. These estimated item-byitem totals were then added to the corresponding ltem totals, as tabulated, for all farms of 1,000 acres and over and farms with estimaterl sales of $\$ 100,000$ and over. The resulting values represent the estimated totals for all farms.

Presentation of Sample Data.- In tables where a small amount of data based on the sample farms is presented together with data for all farms, the data based on the sample are printed in italics. Other tables contaln headnotes explaining that most of the data are estimates based on reports for only a sample of farms.

Rellabllity of Estimates.-The estimated totals for all farms of the items enumerated for only the sample farms are subject to sampling errors. The estimated totals obtained, by makling tabulations for only the farms included in the sample are also subject to sampling errors. State tables 23 and 24 contain approximate measures of the sampling reliabllity of the estlmates for numbers of farms reporting and for item totals. While these measures indlcate the general level of sampling reliabillty of the estlmates, they do not completely reflect errors arlsing from sources other than sampling ; for example, errors in the original data reported by farmers. Errors arising from sources other than sampling may, in some instances, be relatively more important than sampling rariation, especially for county totals.

The general levei of sampling rellability of estinated totais may be determined from the data in State tables 23 and 24. State table 24 contains a list of ltems, together with a figure for each ltem indicating one of the four levels of sampling rellabilly that are presented $\ln$ State table 23. For each item the sampllng error according to the number of farms reporting may be determined from State table 23 , in the column for the level of samplling reliabllity designated in State table 24 . To determine the sampling rellablity for any item, reference must be made to State table 24 to find out which of the four levels of sampling reliability given in State table 23 should be used, and also the approprlate county or State table to obtaln the number of farms reporting the ltem.

As explained in State table 23 , the level uf sampling reliability designated as level 1 should always be used to determine the sampling reliability of estimated numbers of farms or of farms reporting.

State table 23 shows peremtage limits such that chances are about 38 out of 100 that the difference between an estimate based on the sample and the figure that would have been obtained from a tabulation of all farms would be no more than the percentage specified for the estimated number of farms reporting that item. The chances are about 99 out of 100 that the difference woald be less than $21 / 2$ times the percentage specitied.

As indicatec by the percentages in state table 2 ?, the smaller the number of farms reporting a given item, the larger the relative sampling error in the estimated total for that item. Even so, considerable detail is presented for each item, by several ctassifications of farms, in order to permit the appraisal of estimates for various combinations of items not shown in this report. Percentages and averages that may be derived from the tables will generally have greater retative reliability than the corresponding estimated totals. However, significant patterns of relationships may be observed in the estimated totais even though the individual data are subject to relatively large sampling errors.

The data representing estimates based on a sample of farms for the $195 \pm$ census were obtained in essentially the same way as in 1959. Therefore, state tables 23 aml it may also be used to determine the sampling errors for the 1954 dati.

Differences in Data Resulting From Differences in Tabulating Procedures.-Many of the figures in the detailed state tables represent estimates obtained by tabulating ouly the sample farms. The totals for these detailed distributions will generally differ somewhat from totals presented in other tables obtained from different distributions which were tabulated on a 100 percent basis. Moreorer, although most of the figures presented by counties were obtained from tabulations of all farms, the data in county table 4 for commercial farms, and all of the data in the county tables on dairy products and livestock sold, fertilizer and lime, farm expenditures, land-use practices, farm labor, facilities and equipment, and value of land and buildings were estimated for each county on the basis of data tabulated for the farms in the sample. The state totals in the countr tables for these items, though based also on the sample, were obtained in a different series of tabulating runs, and so may differ slightly from totals presented in some State tables. For reasons of economy the sample distributions were not adjusted to the 100 percent totals even when such totals were arailable, nor were slight discrepancies resulting from different runs of the sample data aiways reconciled unless the differences were large enougl to affect the usefulness or reliability of the data.

## PROCESSING OPERATIONS

Completion of Enumeration.-As an enumerator completed his asslgnment, he turned the portfolio containing questionnaires and other census materials over to his crew leader. After making a final review of the enumerator's work, the crew leader mailed the portfolio to the Agriculture Processing Office at Parsons, Kansas. There, each enumerator portfolio was thoroughly checked for completeness of all required forms and for correct application of the sampling procedure.

Editing of Questionnaires.-Each agriculture questionnaire was Individually edited and coded before the information was transferred to punch cards and tabulated. As the first major step in the editing process, questionnaires that did not represent farms according to the census definitlon were withdrawn from fur-
ther prucessing. (See p. XIV.) As the stwont major step, the remaining questionnaires were examined for errors, omissions, and inconsistencies. Among the sperific items subjected to consistency checks were the following:
a. Total acreage compared with its distribution by use.
b. Acreage of individual crops harvested compared with total cropland harvested.
c. Irrigated acreage compared with total acres in the farm.
d. Total acreage of individual crops for all purposes compared with the acreage harvested for specific purposes.
e. Quantity of crops harvested in relation to acreage harvested.
f. Sales in relation to produetion and, for livestock, to inventories.
g. Total livestock compared with the inventury by age and sex.
h. Wxpenditures conumred with production and inventuries.

Obrious errors in calculations or in units of measure, and misplaced entries were corrected as they were found. Entries not clearly legible were rewritten. Many omissions or inconsistencies were disregarded during editing. Those of signifieant magnitute conld be and were handied more ethciently and economically during mechanical processing (perations. Questionnaires contaiuing major inconsistencies and omissions were referred to members of the technical staff for review. Hepending on the magnitude of the data involved, the technical staff corrected (or supervised the comeretion of ) the (ftestionnaires either on the basis of information reported for other farms of similar tyee in the area or on the basis of additional information received in response to letters directed to the farm operators.

Coding of Questionnaires.-Must of the nmmerisal information on a questionnaire was solf-coding in that the inquily number was utilized for the item identification on buneh carls or on tabulations runs. Ilowever, some mannal coding was alsu necessary for such items as irrigated crops for selected States, crops infrequently reported, miscellaneous poultry, etc. Code numbers were entered on questionnaires to classify farms and, in some cases, to identify data for individual items. All farms were coded hy size of farm in terms of total acreage, by race, and by tenure of op ${ }^{+3}$ rator. Farms in the 17 Western States, Louisiana, and Ilawaii were also codod on the basis of irrigated cropland and irrigated pasture. Additional codes were applicd to all farms included in the sample to elassify them by trpe of farm and by total value of agricultural products sold. Individual items were coded only where reports were received for crops or ponltry not covered by separate inquiries on the questionnaire. This coding was necessary to assure inclusion of the data in the alpropriate farm product totals.

Tabulatlon of Data.-After the questionnaires were edited and coded, the information on them was punched on cards. The cards were then mechanically sorted and fed into machines which transferred the data to tabulation sheets. One of the initial and primary steps in the machiue handling of the punch cards was to separate and list those cards which lacked necessary information, those which contained inconsistent or impossible data, and those on which the data were possible but of such magnitude that a further review of the individual questionnaires was warranted. The listing sheets were examined and, as necessary, the cards were corrected. When the cards for a particular cunnty were considered satisfactory, the data were tabulated.

Subject-matter specialists of the Bureau and the U.S. Department of Agriculture examined all tabulations for reasonableness and consistency. As necessary, they made corrections on the basis of a further review and reappraisal of the original reports and verification of the editing, coding, and punching.

## PRESENTATION OF STATISTICS

Statistlcal Content of This Feport.-This report is part of Volune 1 of the 1959 Census of Agriculture. Volume $T$ consists of 54 parts, each bart containing information about agricnlture for a single State, Commonwealth, or Pussession. Each part contains county data for that martionar state or area. The term "county," as used in this retort embraces election districts in Alaska, parishes in Jonisiana, municipios (municipalities) in Puerto Rico, ete. The statistics for 1050 were obtained from the Census of Agriculture taken in the "conteminons [nited States" (see following paragrafl). Hawail, and Pierto Rioo during the period October 1459 to Jamuary 1960 and in Alaska, American Samoa, Guam, and Virgin Islands as of April 1, 1960. Comparative data for years prior to 1950 were obtained from earlier censuses.

In the planning of the publications for the 1060 Censuses of Population and Housing and the 19a! Census of Agriculture. the term "conterminous linited States," recommended bs the Board of Geographic Names to desimnate the 48 State area as it existed before Alaska and Hawaii becarme States, was adopted by the Burean of the Census.

The defnitions and explanations in this introduction for rolume I qenerally hare application broad enough to include the States of Alaska and Flawaii, and the Commonwealth of Puerto Rico and the island possessions. llowever. sperific application in many instances may be limited to the conterminons United States; for axample, referencos to eablier censuses, to the sampling methods and procedures, to specific sections or questions on the questionnaires, and to specifie table nombers.

For each part of volume I (one part for each State or area), a facsimile of the appropriate questionnaice is reproduced in the aptendix.

The statistics for states and counties are presented according to the same general plan as was followed in the volume I reports for the 1954 and the 1950 censuses. State and county totals are given for nearly all items for which information was obtained in the 1959 census. However, most of the data by eeonomic class of farm, type of farm, and celor and tenure of farm operator are given only for States.

Comparative data for the States are given for each census sear heginning with 1920. Comparative data for counties are gisen for the sears 1959 and 1954 . For some items, the data obtained from the 1959 census are the only ones arailable. For comparatire purposes 1950 data are carried in county table 6 for the kind of road on which farms were located.

Comparability of Data.-The data obtained from the various censuses of agriculture are not strictly comparable for all items. For example, differences from one census to another in the time of enumeration, the wording of the questions, and the definition of a farm cause some lack of comparability. Differences considered to have a significant effect on the comparability of data are described in the text and/or mentioned in footnotes to the tables.

Mlnor Civll Divisions.-As in prior censuses, data for most of the items ineluded in the 1059 Census of Agriculture were tabulated for minor civil divisions. The term "minor civil division" applies to the primary subdivision of a county into smaller geographic areas such as townships, precincts, districts, wards, beats, municipalities, etc. Figures for these smaller geographic areas are not included in any of the published reports, but they may be supplied upon request and payment of the costs of compiling and checking the data.

Prior to the 1954 Census, an enumeration assignment did not include more than one minor civil division, even in cases where the township, precinct, atc., did not have enongh farms to provide a full worklead for an ennmerater. In 1954, and agaln in 1959,
the aim was to nake enumeration assignments large enough to keep each enumerator fully ocempied in his area for a 3 - to 4 -week period. llence, in some areas, two or more adjoining minor civil divisions were combined into one emmeration assignment. An enumeration assigmment never comprised the whole of one miner civil division and a part of another, nor a part of two or more minor civil divisions. A minor eivil division that included too many farms for one enmmerator to cover during the ennmeration period was divided into two or bore enumeration assignments.

1 an some cases, the minor civil division tabulations provide totals for a single minor civil division, even when such totals required al grouphin of enmmeration assimmonts. In other cases, the minor civil division tabulations provide totals for a combination of two or more adjoining minor civil divisions. The data for each imbividual minor civil division incluted in such totals can be tabulated selarately, however, since earh questionnaire obtained in the census contains the atesionation of the minor civil division in which the farm headquarters was located. An additional charge must be matle for a selarate tabulation of any small area inchuded in a total for two or more combined minor civil divisions.

Requests for census information for minor civil divisions should be directed to the Agriculture Jivision, Bureau of the Census, Washington 25. D.C.

## DEFINITIONS AND EXPLANATIONS

Descriptive Summary and References.-The definitions and explanations that follow relate only to those items that are consitered to be inadequatty described in the tables where they appear. Althourh the descriptive terms and explanations refer specifically to the 1959 Census of Agriculture, many of them also appls to earlier censuses. Most of the definitions consist of a resumé of the questionnaire wording, supplemented by excerpts from instmetions given to entmerators. For exact wording of the questions and of the instructions included on the questionnaire, see the facsimile of the 1959 Agriculture Questionnaire in the appendix of this report.

An analysis of the questions asked in the 1959 census, and of the data ohtained, is given in Volume IT, General Report, Statistics by Subjects, United States Census of Agriculture, 1959. The general report presents statisties for States by subject matter.

## General Fardi Information

Census Definition of a Farm.-For the 1959 Census of Agricnlture, the definition of a farm was based primarily on a combination of "acres in the place" and the estimated value of a gricultural products sold.

The word "place" was defined to inelude all land on which agricultural operations were conducted at ang time in 1959 under the control or supervision of one person or partnership. (Fer delinition of "agricultural operations", see p. X.) Control may have been exercised through ownership or management, or through a lease, rental, or cropping arrangement.

Places of less than 10 acres in 1959 were counted as farms if the estimated sales of agricultural prodncts for the year amounted to at least $\$ 250$. Places of 10 or more acres in 1059 were counted as farms if the estimated sales of agricultural products for the year amounted to at least $\$ 50$. Places having less than the $\$ 50$ or $\$ 250$ minimmm estimated sales in 1959 were also counted as farms if they conld normally be expected to produce agricultural products in sufficient quantity to meet the requirements of the definition. This additional qualification resulted in the inclusion as farms of some places engaged in farming operations for the first time in 1959 and places affected by crop failure or other unusual conditions.

To aroid biases arising from an enumerator's personal judgment and opinion, the Bureau did not give enumerators the defini-
tion of a farm. Instead, enumerators were instructed to obtain questionnaires for all places cunsidered farms by their uperators and for all other phaces that had one or more agriculturat opera. tions. (See "Agricultural Operations", b. X.) In lata, enumer ators were instructed to fill questionnaires on the same basis as in 1909 . In ThJo, agricultural operations were detined to include every place of 3 or more acres, whether or not the ole rator considered it a farm, and every place having "specialized olerations", regardess of the acreage. "Specialized operations" referred to nurseries and greenhouses and to places having 10k) or more poultry, production of 300 or more dozen eggs in 194日, or 3 or more hives of bees. In all of the threb last cemsures, as a result, questlonnaires were filled for a considerable number of places that did not qualify as farms. The determination as to which questionnaires represented farms was made during office processlug operations and only those questionnaires meeting the eriteria for a farm were included in the tabulations.

For both the 1900 and 1954 Censuses of Agriculture, places of 3 or more acres were counted as farms if the annual calue of agricultural products, whether for home use or for sale but exclusive of home-garden products, amounted to $\$ 150$ or more. Places of less than 3 acres were counted as farms only if the annual sales of agricultural products amonnted to $\$ 150$ or more. A few places with very low agricultural production because of unusual circumstances such as rop failure, were also counted as farms if thes normally could have been expectea to meet the minimum value or sales criteria.

In the censuses from 1925 to 1945 , enumerators were given a definition of "farm" and were instructed to obtain reports only for those places which met the criteria. According to this definition, farms included ali places of 3 or more acres, regardless of the quantity or value of agricultural production, and places of less than 3 acres if the value of agricultural products, whether for bome use or for sale, amounted to $\$ 2 \pi 0$ or more. Because of changes in price level, the $\$ 250$ minimum resulted in the inclusion of varying numbers of farms of less than 3 acres in the several censuses taken during this period. Generally, the only reports excluded from tabulation were those taken in error and those showing very linited agricultural production. such as only a small bome garden, a fer fruit trees, a small flock of chickens. etc. In 1945, reports for places of 3 acres or more were tabulated only if at least 3 acres were in eropland and/or pasture or if the value of products in 1944 amounted to at least $\$ 150$.
The decrease in the number of farms in 1950 and 1954, as compared with earlier censuses, was partly due to the ehange in farm definition, especially with respect to farms of 3 or more acres in size. Some of the places of 3 or more acres that were not counted as farms in 1950 and 1954 beeause the value of their agricultural production was less than $\$ 150$ would have qualified as farms if the criteria had been the same as in earlier censuses.

For 1959, the decrease in the number of farms as compared With all prior censuses resulted partiy from the change in farm definition. The fact that sales of agricultural products in 1959 was used resulted in the exclusion of some places that would have qualifled as farms bad the value of agricultural products alone been consldered. The increase in the acreage minimum also had an effect. The reduction in the number of farms due to change in defintion, 1954 to 1959 , is shown for each county In county table 1. Some charaeteristies of the places not counted as farms in 1959, but which would have been included in 1954 , are shown in State table 10.

The change in farm definition made in 1950 and again in 1959 bad no appreciable effect on the totals for livestock or erops because the places affected by the change ordinarily accounted for less than 1 percent of the totals for a given county or State.
For the States that comprise the conterminous United States, two figures are publisbed for each county on the number of farms
in 1954. One is an actual cotnont of all farme and the other is son estimate based on the nomber of firmas inctariod in the sample. For almost every county therr is a difforonees betwera tha atomal number of farms and tho estimated mambor of forms. becaluse

 ber of farms. For most comblios, the atotulatamber of farms in the smmple was either more or lase than preeinely og fercent "f all farms Similarly, totals fetimeited on the basis of datat for the sample farms mas lie slixhtly mare or slimhty bexs than the actual totals that would have been obtained had the data been tabmated fur all farms. Thorefora, the ertimatenl bunamo of farms reporting certain items maty. in sume instamex. life areater than the total number of farms shewn in conmaty fable 1. lawerer, the estimated number of farms is miven in commty tables $\bar{t}$ and 6 so that cistimates hased on the sumble farms may be related to the estimated rather than the wetual number of farms.

Farm Operator.-The term "fimm nipratur" ju nund to designate a person who oiferates a farm, eithor doing the worli himself or directly supervising the work. He may he the owner, a mamber of the owner's honsehold, a hired manager, or a tenant, renter, or sharecronper. If he rents land to others or has land worked on shares loy others, he is considered as wheratur only of the land which he retains for his own operation. In the case of a partnership, only one partaer is comited as an operator. the number of farm operators is consitered to he the sanue as the nmmber of fitrms.

Farms Reporting or Operators Reporting.—F"ixures for filmus re
 represent the number of farms, or alerators, fur which the suecified item was reported. For exalulle, if there were $1 . b 2 \mathrm{~m}$ farms in a eounty and omly 1,46 had chickens 4 monthe wh :mul wert on hand at thet time of enumeration, the number of farms reporting chickens womld be slomb as $1.4 f .5$. The difference between the total number of farms and the number of farms reforting a partirular items represents the number of farms not having that item, provided a correct report was received for all farus.

Where applicable. figures inay be given for the number of farms or operators not reporting items that were intonded to be obtained for all farms; for example, resielence of farm "perator, State table 4. The number not repurtins. as comblared with the total number of farms or oberators, indisates the extent of incompleteness of the reporting of the data for the item.

Land Area.-The apmoximate total land area of States and counties as reported for lam is, in general, the samp as that reo ported for all censuses herinning with litu. Surll differemes as are shown reffect molitical "hanges in boundaries or actual changes in land area caused by ehanges in the number or size of reservoirs, lakes, streams, ete. For Alaska, the areas for election districts represent the gross area of land and water.

Land in Farms.-Except for managed farms, the land to be included in each farm was determined from the answers to questions about the number of acres owned, the number of acres rented from others or worked on shares for others, and the number of acres rented to others or worket on shares by others. The acres owned and the acres rented from others or worked on slises for others were first added together and then the acres rented to others or worked on shares by others were subtrated. The result represented the number of acres in the farm. The number of acres in a managed farm was the difference between the total land managed and that part of the managed land that was rented to others or worked on shares bs ot hers.

In the 1959, 1954, and 1950 censuses, emmatators were instructed to record total firures for land ownet, land rented from others, and land managed for others, inchuling any part of the land that was rented to others. Jn censuses prior to 1950 , enu-
merators were instructed to exclude all land rented to others and to record only that portion of the acreage owned, rented from others, or managed for others that was retained bs the firm operator. Thus, the figures for the individual tenures of land are not entirely comparable for all censuses. However, the land included in each farm was determined on essentially the same basis for all censuses,
The acreage designated in the tables as "land in farms" consists primarily of "agricultural" land-that is, land used for crops and pasture or grazing. It also includes considerable areas of land not actually under cultivation nor used for pasture or grazing. For example, the entire acreage of woodland and wasteland owned or rented by farm operators is included as land in farms, unless it was being held for nonagricultural purposes or unless the acreage was unnsually large. For 1959 and 1954 , if a place had 1,000 or more acres of woodiand not pastured and wasteland, and if less than 10 percent of the total acreage in the place was used for agricultural purposes, the aereage of woodland not pastured and wasteland was reduced to equat the acreage used for agriculture. The procedure used in 1950 for exeluding unusually large acreages of woodland not pastured and wasteland differed slightly from the one used in 1959 and 1954. In 1900. adjustments were made in places of 1,000 or more acres ( 5,000 or more in the 17 Western States), if less than 10 percent of the total acreage was used for agricultural purposes.
Except for open range and grazing land used under government permit, all grazing land was to be ineluded as land in farms provided the place of which it was a part was a farm. Grazing land operated by Grazing Associations was to be reported in the name of the person chiefly responsible for conducting the business of the Association. Land used rent free was to be reported as land rented from others. All land in Indian resercations that was used for growing erops or grazing livestock was to be ineluded. Land in Indian reservations that was not reported bs individual Indians and that was not rented to non-Indians was to be reported in the name of the comperative group that used the land. In some instances, an entire Indian reservation was reported as one farm.

Land owned.-All land that the operator and/or his wife held under title, purchase contract, homestead law, or as heir or trustee of an undivided estate at the time of enumeration is considered as owned.

Land Rented from Others.-This item includes not only land that the operator rented or leased from others hut also land he worked on shares for others and land he oceupied rent free. Grazing land used under government permit or license is not included.

Land Rented to Others.-This item includes all land rented or leased to others, except land leased to the government noder the Soil Bank, and all land worked by others on shares or on a rent-free basis. For the most part, the land rented to others represents agricultural land but lt also ineludes land rented for residential or other purposes. The tenant or sharecropper is considered as the operator of land leased, rented, or worked on shares eren though his landlord may supervise his operations. The landlord is considered as operator of only that portion of the land not asslgned to tenants or eroppers.

Land Managed.-Thls item includes all tracts of land man aged for one or more employers by a person hired on a salary basis. A hired manager was considered to be the operator of the land be managed since he was responsible for the agricultural operations on that land and frequently supervised others in performing those operations. Managed land was always to be reported on a separate questionnaire whether or not the manager also operated a farm on his own account.

Land in Two or More Counties.-An individual farm was always enumerated in only one county, even in eases where the land was located in two or more counties. If the farm operator lived on the farm, the farm was enumerated in the county where he lived. If he did not live on the farm, the figures for the farm were tabulated for the county where the farm headquarters was located. In cases where there was any question as to the location of the headquarters, figures for the farm were tabulated for the county where most of the land was located.

Land in Farms According to Use.-Land in farms has been distributed aceording to the way in which it was used in 1959. The land uses described in the following paragraphs are mutually exclusive; that is, each acre of land is included only once even though it may have had more than one use during the gear.

Cropland Harvested.-This category refers to all land from which any ermb were haryested in 1959, whetber for home use or for sate. it includes land from which hay (including wild hay) was cut and land in herries and other small fruits, orchards, vineyaris, murseries, anl greenhouses. Matured erops hogged off or grazed were considered to have been "erops harvested" and were reported here. Land from which two or more crops were harvested in 1909 was to be counted only once in the land-use classification. Land used for other purposes either hefore or after the crops were harvested was to be reported as cropland harvested, without regard to the other uses.

The enumerator was instructed to check the figure for eropland harvested for each farm by allding the aereages of the individual crops and subtracting the acreages from which two or more crops were harvested. This checking procedure was repeated during the office processing of questionnaires for all farms having 100 or more acres of eropland harvested.
Cropland used only for Pasture.-This land-use classification includes rotation pasture and all other land nsed only for pasture or grazing that the operator considered could hare been used for erops without additional improvement. Enumerators were instructed to include land phanted to crops that were hogred uff, pastured, or grazed before maturity but to exclude land pastured lefore or after hay or other erops were harvested from it. Pemmant open pasture mar have been reported either for this item or for "other pasture" depending on whether or not the merator considered it as eropland.
The figures for 1045 and earlier censuses are not entirely comparable with those for the last three censuses, For 1945, the figures include only cropland used solely for pasture in 1944 that had been mowed within the ureceling seven years. The figures for 1940, 1935, and 1925 are more nearly eomparable with those for 1959, 1954, and 1950, however, beeause they include land pastured that could have been plowed and ased for crops without additional clearing, draining, or irrigating.

Cropland not Harvested and not Pastured.-This classification represents a total of three subiclasses for the 17 Western States and two subclasses for other States.

Cultivated Summer Fallow.-This subelass of land is shown only for the 17 Western States. It refers to cropland that was plowed and cultirated but left unseeded for the 1959 harvest in order to control weeds and conserve moisture.

Soil Improvement Grasses and Legumes.-For the 115:2 census, hand used only for cover crops to control erosion or to be phowed under for wreen manmee is tabulated separately from "other "ropland". After the estallishment of the Soil bank, hand that would mormally have been used for other purposes was frequentls planted to sil-improvement crops. In counties where large arrages were placed in the Soil Bank, the total of land used for soil-improvement crops phas "other cropland" may be considerably larger than the "other cropland" shown for previous censuses.

Other Cropland.-This subclass includes idle eropland, land in crops intended for harvest after 1950, and eropland not harvested because of complete crop failure, low prices, labor shortage, or other reasons. The 1959 figures for "other cropland" are not entirely comparable with those for previous censuses since they do not include land used only for soit-improvement erops. (See preceding paragraph.)
Woodland Pastured.-This classification includes all woodland where livestock were pastured or grazed in 1959. The instruction on the questionnaire.-"Include as woodland all wond lots and timber tracts; cutnver and deforested land which has value for wood products and has not been improved for pasture"-represents a somewhat more precise definitiou than the corresponding instruction contained on the 1054 questionnaire. No definition of woodland was given in 1950 apart from an instruction to enumerators not to include brush pasture as woodland. Some of the changes in womdand acreages from one census to another mas merely represent differences in interpretation as to what constitutes "woodland."
Woodland not Pastured, This classification refers to all woodland not used for pasture or grazing in 1959, including land in operated farms that was placed in the Soil Bank and planted to trees. Unusually targe tracts of timberland that were reported as woodland not pastured were excluded from
the tabulation of land in farms when it was evident that such land was held primarily for nonagricultural purposes.

Other Pasture.-This classification refers to all land other than woodland and cropland that was used only for basture or grazing in 195\%. It includes moncrop otern or hrush pasture and cutover or deforested land that has been improved and used for pasture. The figures for the last three censuses are eomparable but those for 1945 include all honwombland pasture that had not been plowed during the preceling selan years. For the 1940 census and earlier years, the tigures are more nearly comparable with those for the last three celsuses. However, the elassification mas be somewhat less inclusive because land that could have been plowed and used for crops without additional clearins, draining, or irrigating was classified as plowable pasture and inctuded with "rrophond used only for pasture".

Improved Pasture. -This sublass refers to that mortion of "other pasture" on which one or more of the following practices had lwen used: liming, fertilizing, seothg, irritating. draining, or the clearing of weed or Irush growth. The fisures are comparable with those for 19.4 , when the question on improved pasture was asked for the first time.
Other Land.-This classification refers to all land not included in the preceding land-use classifications, such as bouse lots, barn lots, lanes, roads, ditches, land area of ponds, and wasteland. This figure for 19.9 was ubtained from the machine tabulations by subtracting the total of all other uses from the total land in all farms reported for a given counts or classification. IIence, there is no fisure given to represent the farms reporting this item.
Value of Land and Buildings. - Only arerage values of land and buildings per farm and per acre are presented in this report. They are estimates based on data mbtained for sample farms. Estimates of the total value of land and buildings ly States, geographic divisions, and the United States, are presented in volume II.

The enumerator was instructed to recorl the market ralue of the land and the buildings on that land. Market salue was defined as the price which the farm operator would expeet to receive for the land and buildings if he were to sell them on the day of enumeration.
More problems and difficulties arise in the enumeration of farm-real-estate values than in the enumeration of most other agricultural items. Most of the items enumerated require the respondent to make a statement of fact. For example. iaformation about the number and ralue of farm animals sold alive during the sear is based on aetual transactions. Similarly, information about livestock inventories relates to the situation existing on a speeifie place at a specifie time. Reports concerning the value of land and buirdings, however, are estimates based almost entirely on opinion. The majority of farms bave not changed bands for many years and are not currently for sale. For such farms, the operators are not likely to have any clear basis for estimating the value. To make an intelligent and objective estimate, a respondent first needs to make an estimate of the prevailing arerage market ralue of farms in his community. Then, he must either add to or subtract from that estimate to allow for the different characteristics of his own farm. In many eases, an operator who would not sell his farm under any cireumstances way report an unreasonably high market value. In other cases, a farm operator who acquired bis real estate during a period of relatively low prices may estimate an unrealistically low value by current standards. Because of the extent of variation that is known to exist in real estate values, it is difficult to devise ehecking procedures that will identify inaceurate estimates.

Age of Operator.-Farm operators were classified by age into six age groups. The average age of farm operators was derived from the sum of the ages of all farm operators reporting age divlded by the number reporting. The number of farm operators 65 or more years of age is an actual count based on the operators reporting age.

Residence of 0perator.-Farm omeratnrs were clascindab by residence according to whether ar not they lived on the farms they were onerating. Some of those who did not live on the farms they uperated themselves lived on farms merated by whers. In "ases where all the land was rented from others or worked on shares for others, the onemon was considered te live on the farm operated provided the dwelline be ocmped was ineluted in the rentell agreemant. The dwelline, in surll cases, was mot necessarily on the land being onerated. Similarly, a farm operator who did not live on the land heing cultivated or srazed but who hat some agricultural (iperations (other than a home garden) at his dwellint was consibered as living on the farm operated.
Since some farm olerature live on their farms only during a part of the year, cumparabilits of the figures for various censuses may be affected by the date of enumeration.
In a few cases, the emmeratur failed to report the residence of the farm ijerator. Wffurences between the total numier of farms and the mumber of farm operators classitied by residence indicate the extent of under-reporting.

Year Began Operating Present Farm.-Enumeraturs were instructed to report the year during which a farm operator began to operate his present farm and, if the rear was 1958 or later, also to report the month. The year was intended to refor to the first gear of the period during which the operatur had been in continunus charge of his present farm or of any part of it. The time of sear that farmers move is indicated by the month thes began operating their farms, as shown by a monthis breakdown of the reports for farmers who began operating their present farms during 1958 and 1959.

Off-Farm Work and Other Income.-To obtain a measure of the extent to which farm operators rely on nonfarm sources for part of their income, four questions were asked of all farm operators. The first question asked fur the number of days the operator worked off his farm in 19.5 . The other three ruestions, to be answered "Yes" or "No," asked (I) whether other members of the operator's househotd did any work off the farm ; (2) whether ans income was received from sources other than the sale of ayricultural products from the farm operated; and (3) whether the combined income of all members of the honsehold from off-farm work and other sources was wreater than the total value of agricultural products sold from the farm "rerated.

Off-farm work was defined to include work on someone else's farm for pay as well as all types of nonfarm jobs, businesses, and professions, whether the work was done on the farm premises or elsewhere. Exchange work was not included.
The questions asked in the 1959 Census are closely comparable with those asked in 1954 . The data for 1959 are actual totals of all operators reporting off-farm work and other income whereas those for 1954 are estimated totals based on the sample.
Equipment and Facilities.-In 19.59 as in several earlier censuses, data about sleeified equipment and facilities were obtained for only a sample of farms. Farm operators were asked to report equipment and facilities that were on the farm at the time of ennmeration, regardless of ownership. They were to inclucle items that were temporarily out of order but not any that were worn out.
Data in terms of actual number were obtained for the following items of farm equipment in 1959: (I) grain combines, (2) corn pickers, (3) pick-up balers, (4) field forage harvesters, (5) motortrucks, (6) wheel tractors, (7) garden tractors, (8) crawler tractors, and (9) automobiles. Definitions given enumerators included the following specifications, among others: Corn pickers related to all types of machines used for picking corn, whether used in separate or ln combined pieking-shelling operations. Pick-up balers were to include both hand-tie and automatic balers but not stationary ones. Motortrucks were to include pick-up trucks and truck-trailer combinations; jeeps and station wagons
were also to be included if they were used primarily as trueks, but school muses were specificalls excluded. Wheel tractors speeifiealls excluded garden tractors, implements with built-in power units, such as self-propelled combines or powered buck rakes, and the power unit of a trucktribler combination. Automobiles were to include jeeps and station wagous if thes were used primarily as passenger cars.

Questions to he answered "Yes" or "No" provided information as to the presence or absence of the fullowing items: (1) telephone, (2) home freezer, (3) milking machine, (4) electric milk cooler, (5) hulk-trpe milk cooler (in six States only-Miehigan, Mirnesota, New York, Ohio, Pemsylvania, and Wisconsin), (6) erop drier and (7) power-operated elevator, eonveyor, or blower.

Comparable data from one census to another are not available for all items. The questions asked about equipment during a given census reflect changes in farm mechanization and in the facilities avalable to farm families. Questions about some items of equipment were asked in 19 for the first time (electrie milk cooler, erop drier, hulk-type milk eooler, etc.). Similarls, some questions that were asked in earlier censuses were omjtted in 1959. Fur example, the use of electricity is now so widespread that there is no longer any need for obtaining a count of the farms having it.

Farms by Kind of Road. The classification of farms by the kind of road on which they are located is lased on only a sample of farms. The enumerator was instructed to report, on the basis of his own observation, the kind of road on which the most Prequently used entrance to the farm was located. For farms consisting of two or more tracts, he was to limit his report to the tract on which the farm oferator had his dwelling or other headquarters.

Farm Labor.-The questions about farm labor were asked only for the sample farms and related to persons working during the calendar week preceding the week of enumeration. Since the enumeration starting dates varied by geographic areas, and the entumeration within each area lasted over a nuriod of severat weeks, the calendar weeks to which the data aprly also vars. Thus, the data for an individual farm mar relate to any one Week during the months of October, Novemher, or December, or even, in a few instances, to weeks during Sentember 1950 or Januars 1900.

Farm labor was defined to include any work, ehores, or planning necessary to the agricultural operations of the farm; and to exclude housework, eontract construction work, custom machine work, and repair, installation, or construction work done hy persons employed speeifieally for such work. The farm labor information contained in this report represents estimates hased on answers to fuestions relating to the farm work or chores done during the week by (1) operator, (2) unfaid mombers of the operaturs famils, and (3) hired persons. An operotur was considered as working if he worked one or more hours; unpaid members of the operator's family, if they worked is or more hours; and hired persons, if they worked at all during the week.

Data are not fully comparable from one census to another, primarily berause of differences in the period to which they relate. In 1954 , the data were purposely related to either one of two calendar weeks, depending in part on the starting date set for the enumeration and in part on which week represented a period of peak employment within a given State. For the majurity of States, the period specified was the woek of Seltember 26-October 2 ; for other States, the week of October $24-30$.

In 1950, as ln 1959, the data related to the weok preceding the actual enumeration. Unlike 1959, however, enumeration starting dates were identical for all States in 19.0 (April 1) but since several weeks were required to complete the ennmeration, the ealendar week preceding the enumeration was not identical for
all farms. In 1945 and 1935, the number of farm workers related to the first week in January and, in 1940 , to the last week in March. In 1945, 1940, and 1935, only persons working the equivalent of two or more dass during the specified week were to be ineluded. In 1945 and 1940 , an additional specifieation limited the workers to those 14 years old and over.

Experience gained from earlier censuses indicates that farm labor data are often unsatisfactorily reported unless the week specified is the week immediately preceding the actual enumeration. When a farm operator was asked to report the number of persons emplosed during a specified week that was several weeks frior to enumeration, he often reported the highest number of bersons employed during the year. Obviously incorrect reports were adjusted to make the data reflect more nearly the situation known to exist during the specified week. The farm labor data for 1954 relates to a specified week which, in some cases, was several weeks prior to enumeration. Few adjustments were made in those data, however, even though there were indications of ineorrect reporting.

Regular and Seasonal Workers.-Hired persons working on the farm luring the neek euncerned were classed as "regnlar" workers if the period of actual or expected employment was 150 days or more during the year. They were classed as "seasonal" workers if the period of actual or expeeted emplorment was less than 150 days. In cases where the period of employment was not repurted for an individual farm, it was estimated from data fur such items as hasis of parment, wage rates, expenditures for labor in 1950, and type of farming operations.

Hired Workers by Basis of Payment.-Hired persons were also elassified according to whether they were paid on a monthly, weekts, dails, or hourly basis, or bs piecework. In cases of incommete reporting, the basis of payment for hired workers was supplied during the office processing operations.

Wage Rates and Hours Worked.-The agreed rash rate of pay was asked for each elass of hired worker except those emfloyed on a piecework hasis. (The mmber and the earnings of persms paid on a piecework basis were required for those who worked on Fridas of the week precedinir the emmmeration.) The number of lours that workers were expected to work to earn their pay was asked for wach class excerpt those eluployed on an hourly or piecework hasis. For 1059 and 195t, the data inchute othce estimates for farms suburitting ineumplete reports of wage rates and hours worked. The estimates were consistent with the size and type of ouerations for the imbividual farm as compared with sinilar farms in the area for which complete reports wore received. The corresponding data for 1950 apply only to farms that reported hoth wage rates and hours worked.
Fertilizer and Lime.-The questions about fertilizer and lime, asked only for the sample farms, relate to the acreage on which fertilizer and lime were used and to the quantity used. Farm operators were asked to report total quantities used in 1950 on the farms they nperated regardless of when or br whom the fertilizer and lime were purehased. In the sontli, some landords who operated farms thenselves included the frotilizer and lime they had purchased for use on their tenant-operated land. Sueh fertilizer and lime may also have been reported by the tenants. When double reporting was detected during the editing process, the data on the questionnaires concerned were adjusted to eliminate duplication in the totals.

The 1959 data for fertilizer and lime are entirely comparable with those for 1954. A breakdown between dry and liquid fertilizing materials was not obtained in 19Jt aud data on cost of either fertilizer or lime were not obtained in 1959 .

Fertilizer.-The relort for fertilizer was to refer only to eommercial fertilizer and fertilizing materials, inclubling roek phosphate. The aeres fertilized and the tons of fortilizer apHitd to those acres were obtained semarately for selected crops. The stlacted crobs varied by region so that it was mosible to ohtain detailed data for the erops most commonly fertilized in each region. In cases where the mame land was used for more than one erop, the acres fertilized were to be reported separately for each crop. If the same crop was fertilaced more than once, however, the acres in that erop were to be reported only once. In all cases, the total quantity of fer-
tilizer used in 1959 was to be reported, induding quantities used on tand occupied by crops phanted in 1958 or by crops to be harrested in $1!60$.

Reports for quantity of fertilizer and fertilizing materials used were required for botb dry and licuid materials. The terms "dry" and "hiquid" referred to the form in which the fertilizers and fertilizing materials were purchased and not to the way in which they were applied. Thas, dry fertilizers were those parchased in dry or solid form, as powders, dusts, granules, bellets, ete: liquid fertilizers were those purchased in fluid form, as solntions or as liquefled gases.

Lime.-The lata for lime relate to the total acreage limed in 1959 and the total tomage of lime and liming materials used on those arres for purposes of conditionins the soil. lastructions on the questionnaire stated that ground limestone, hy drated and burnt lime, mari, and oyster shells were to be included but that lime used for spraging or sanitation purposes was to be omitted.

For some counties, the tonnage of lime shown in the table may be less than the tonnage reported for the Agrieulture Conservation lrogram or the Conservation Reserve Progran of the Soil Bank. Differences may be due either to sampling error or to under-reporting by farm operators. Mang of the differences are minimized or eliminated entirels in the data presented on a State or regional basis.
Specified Farm Expenditures.-The data for farm expenditures are estimates based on reports obtained from the sample farms. The 1959 questionnaire contained questions for six items of farm expenditure: (1) purchase of feed for livestock and poultry, (2) purchase of livestork and pouitry, (3) machine hire, (4) hired labor, (5) seeds, bulbs, plants, and trees, and (6) yasoline and other petroleum fuel and oil. With the exception of items (2) and ( 5 ), exactly the same questions were asked in 1954. For each item specified, the total expenditures made for the farm in 1959 were to be reported, whether made by the farm operator, his landiord, or both. A farm operator who rented part of his land to others was to report only the ex!enditures for the land he operated himself. Enumerators were instructed tu ask respondents who had difficulty estimating their expenses for the period between enumeration and the end of the year to estimate them on the basis of current costs.

Feed. -The report on feed purchased for livestock and poultry was to include expenditures for grain, bay, millfeeds, pasture, salt, condiments, concentrates, and mineral supplements as well as for the grinding and mixing of feed. The estimated cost of items furnished by a landlord, contractor, or other owner for feeding poultry and livestock kept on the farm was also to be inchuded. Payments made by i temant to his landlord for feed grown on the tenant farm were to be exchaded.
Livestock and Poultry.-The cost of bahs chicks and turkey poults was to be included in the expenditures made for the purchase of livestock and poultry. Enmmerators were instructed to ask the farm operator to inchude the cost or estimated purchase value of poultry and livestock provided by others and cared for by the operator under a contract feeling arrangement. The cost of livestock purchased for resale within 30 days was not to be included. A short-term transaction of that nature was considered to be a dealer operation, not an agricultural one.

Data on the purchase of livestock and poultry were not obtained in 1954 . The instructions for the 1950 census specified that expenditures for domestic rabbits, fur-bearing animals kept in captivity, and bees were to be lacluded. Any lack of comparability in the 1950 and 1959 data resulting from inclusion or exclusion of rablits, fur-bearing animals, or hees is considered to be so slight as to be insignificant.

Machlne Hire.-Expenditures for machine bire relate to custom machine work, such as tractor hire, threshing, grain or seed combining, silo filling, baling, cotton picking, cotton ginning, corn picking, plowing, vegetable harvesting, fruit picking, spraying, and dusting. Any amount spent for the labor included in the cost of machine hire was to be considered as part of the total expenditure. The cost of freight or trucking and exchange work without pay were to be omitted.

Hired Labor.-Expenditures for hired labor were to include total casb payments made in 1959 to family members and to others for farm labor. Payments to persons supplied by a contractor or a cooperative organization and paid directly by them or by the crew boss were also to be included. Payments
for the following types of work were to be excluded: housework, contract eonstruction work, custom machine work, and repair, installation, or construction work doue by persons specifically employed for such work.

Gasoline and Other Petroleum Fuel and 0il.-Expenditures for gasoline and uther petroleum fuel and oil were to relate only to the products used in the farm business. Enumerators were instructed to exclude the cost of petroleum products used for the famity automobile when operated for other than farm business purposes and of products used in the farmhonse for heating, cooking, and lighting.

Seeds, Bulbs, Plants, and Trees.-Expenditures trere to repre. sent the total amount spent for seeds, bulbs, plants, and trees to be used on the farm onerated. The value of seed grown on the farm was to be excluded. For nurseries and greenhouses, the eost of products purchased for immediate resale was also to be excluded.
'This item of expenditure was not included in the 1954 Census. The data are comparable with those for 1950 , however.

## Crops

Crops Harvested.-The $\mathbf{1 9 5 9}$ agriculture questionnaire was similar to the questionnaire used in several previous censuses in that it provided for the collection of detailed data for all crops harrested on each individual farm. The variation in the crops listed on the questionnaires used in different States made possible the separate reporting of all important crops grown in a given area. All versions of the questionnaire contained several "All other crops" questions where crops not specifically listed in separate questions were to be repurted.

Acreage of Crops Harvested.-In most instances, the acreage reported for individual crops represents the area harrested during 195:. The area harvested is often less than the area pianted. For fruit orehards and groves, vineyards, and planted nut trees, the acreage reported represents the total area in both bearing and nonbearing trees and vines as of the date of enumeration-usualls a date in October, November, or December 1959. For soybeans, cowpeas, and peanuts, the acreage grown for all purposes was reported as well as the acreage harvested for suecific purposes. For velvet beans, only the acreage grown was reported. As the enumeration was about to begin in South Florida (those counties in which the enumeration was hegun on Octoher 7), an instruction was issued to the effect that the data for vegetables and potato crops should relate to a full year, beginning on October 1, 1958, and ending September 30, 1959.
Quantity of Crops Harvested.-Except for citrus fruits, olives, avocados, and for vegetable and potato crops in South Florida (see preceding paragraph) data for quantity harvested relate to the calendar year 1959. For citrus fruits, the quantity harvested from the bloom of 1958 for the $1958-59$ marketing season was to be reportea. For olives, the crop harvested in 1959 was to be reported for all States except California and Arizona. Enumerators in those two States were instructed to report olives harvested from the bloom of 1958 during the $1958-$ 59 harvest season (September 15. 1958, to February 28, 1959). In the case of avocados, the data for California were to relate to the quantity harrested from the bloom of 1958 for the marketing season that extended from October 1, 1958 to September 30,1959 ; the data for Florida mere to relate to the crop harvested for the marketing season that extended from July 1, 1959, to February 28, 1960. Respondents were to estimate quantities not yet harvested at the time of enumeration.
Unit of Measure.-The unit of measure in which quantities were to be reported has varied for some crops, not only from State to State, but also from census to census. The aim has been to permit reporting in the units of measure currently in use. In the State and county tables, the quantities harrested for each crop are usually expressed in the unit of measure given on the 1959 agriculture questionnaire. In 1959, for corn and Irish potatoes, a choice between two units in which to report the production was given in some States. (See the discussion for those crops.) To provide readily comparable information, data published in earlier reports in different units of measure generally hare been converted to the units used in 1959.

Corn.-In the 1959 census, detailed questions regarding the purpose for which corn was harvested were asked in all States. For most States, bushels was the only unit specified for corn
for grain. In sone areas, however, where farmers were not accustomed to using hushels as the unit of measure, the questionnaire contained a provision for the quantity of corn for grain to be reported either in bushels (shelled basis) or in baskets of ear corn. As in former censmses, some rehurts were received in units of measure other than buslets or baskets. Prior to tabulation, all reports were converted to bushels (shelled basis) on the basis of the following factors: 70 pounds of ear corn, 2 baskets of ears, or 50 pounds of shelled curn equal one bushel. A harrel of ear coln was usually considered equal to 5 bushels of shelled corn.

Annual Legumes_-For soyheans, fowfeas, and pranuts, the acres and mantity grown or harvested for suedife purposes, as well as the total arreage grown for all purposes, were obtained for areas where these chos are grown extensively; for velvetbeans, why the total grown for all purposes was obtained. For all these ram except, possibly peanuts, the total acreage grown for all purposes indmbes some acreage that was phowed under for green manure. In a few Southern Antates, separate fignres were oltained for the acres grown alone and the acres grown with other (rops. In 10nt, as in 10.4, cnumerators were instrutted to ropmet quepll sobbeans and blackeses and other green cowpeas harrested for sale as vegetables and not as anmal legumes.

Hay Crops.- Hata for the total acres of land from whith hay was cut exclude the acreage in sorghum, stoyben, cowpea, and foanat hays. These erens were reborted in sebarate fuestions in the Status where they are important. To whtain the total acres from which wher havs were cut, the acres of the various hay erops, including grass silaze. were added together for each county. The corresponding totals for 10,4 were obtained by the same procedure. For the 1950 census, however, the totals were based on farmers own reports of their total atreage in harvested hay crops.

The questionnaire comtained an instruction that if two or more cuttings were made from the same land, the totil production from all cuttings was to be reported but the acres cut were to be counted only once. In cases where buth hay and grass silage were cut from the same land, the total acreage was to be reported for buth crops. In 1959. as in 1954, alfalfa hay inmulet alfalfa and alfalfa mixtures for hay and for dehstrating : clover and timothy hay inchuled clover, timothy, and mixtures of clover and grasses: small grain hay included oats, wheat, barles, rye, or other small grains rut for has. The hay crops listed on the questionnaire varied somewhat from one state or region to another. The kinds of hay to le ineluded in separate questions can be detelmined for a specitic State from reference to the faesimile of the fuestionnaire that is in the appendix.

The tonnage of hay, including alfalfa hay for delydrating, is given on a dry-weight basis. Prior to tabulation, production reported in mreen weight was converted to its dry-weight equivalent by dividing by 3 . However, the production of grass silage is given in terms of green weight.

Field Seed Crops.-The field seed crops listed on each version of the questionnaire were limited to those considered most important within the giren State. Each version of the questionnaire contained space for listing other field seed crops in order to facilitate the reporting of all field seed crops harrested. Quantity harrested was to be reported in terms of clean seed for most field seed crops. Bhegrass, or Jumegrass seed, was to be reported in terms of green seed for Iowa, Kansis, Kentucky, Minnesota, Missouri, Nebraska, North Dakota, South Dakota, and Tennesseet. No mention was made of "green-weight basis" for other States where this crop was to be reported in the "All other" question.

Irish Potatoes and Sweetpotatoes.-For Irish potatoes and sweetpotatoes (including yams), the total quantity harvested was to be reported for each crop in ail cases, whether harvested for
home use or for sale or whether used for lirestock feed. The acreage harvested was to be revorted for each crop only in cases where the quantity amounted to 20 or more bushels (or the approximate equivalent in terms of hundredweights, barrels, or pounds, as explained on different versions of the questionnaire). This method of reporting was designed to facilitate the enumeration of potatoes harvested on small plots for home use. Essentially the same procedure was followed in both 1954 and 1950. In earlier censuses, however, the acreage of Irish potatoes and sweetpotatoes was to be relorted in all cases, even when production was solely for home use. Therefore, the data on acres for censuses prior to 1950 are not fully comparable with those for the last three censuses, especially in counties or States where production is largels for home use.

The unit of measure in which quantity was to be reported varied from one State or region to another to correspond with the units most conmonly used in a given area. In 27 States, the questionuaire provided a choice for reporting either bushels or 10 -pound hags (hundredweights). The published data for countles and states are in terms of bushels.

Berries and Other Small Fruits.-The question for berries and other small fruits related specifically to the acreages and quantities harrested for sale. Only tame or cultivated berries were to be reported except for the New England States, where wild blueberries were also to be included. Enumerators were instructed alwasis to repurt the total quantity of each kind of berry harvested for sale but to report the area harrested only when it amounted to one-tenth acre or more. Nonbearing areas and areas and quantities harrested for home use were to be excluded. The data for 1959 and 1954 are filly comparable.

Tree Fruits, Nuts, and Grapes.-In 1959, as in 1954, fruit trees, nut trees, and grapevines were not enumerated for farms having a combined total of less than 20 at the time of enumeration. Both bearing and nonbearing trees and vines were to be inciuded but not any that had been abandoned. For censuses prior to 1954, all fruit or nut trees and grapevines on the farm were to be enumerated, regardless of the number. Because of this change in enumeration procedure, the data for 1959 and 1954 are not fully comparable with those for earlier censuses. In commercial fruit-producing countles, the change in procedure may have had a considerable effect on the number of farms reporting without causing any significant changes in the number of trees and vines nor in the quantity harrested. In counties where most of the trees or vines are in small plantings and where production Is largely for home-use, however, the change may hare cansed a significant reduction not only in the number of farms reporting but also in the number of trees and vines and In the quantity harvested.

In both 1959 and 1054 , the area $\ln$ frult orchards, groves, vineyards, and planted nut trees was enumerated when there were 20 or more fruit trees, nut trees, and grapevines. In 1950, the corresponding area was enumerated only if it amounted to one-half acre or more. In censuses prior to 1950 , the area was to be reported regardless of its size or of the number of trees and vines. Enumerators frequently omitted the fractional acreages in small plantings and home orchards, however. In some counties, small plantings or home orchards comprise a sizeable proportion of the total fruit and nut acreage. For those countles, the change from one census to another in acreage of land in fruits and nuts may not be due to fact but merely to differences in ennmeration.

In 1959 , California was the only State for which the acreage In each individual fruit and nut crop was obtained. In 1954, such acreage was also obtained for Arizona. In all States, the number of bearing and nonbearlng trees or vines on the farm at the time of enumeration and the quantity harcested in 1959 were to be reported separately for each fruit and nut crop. (Exceptions in the harvest period for citrus fruits, avocados, and
 quantities were to be reported variod from one state to another. Tables in this report show quantios in the unit of measure appearing on the 1959 questionmiras used in the state.

Nursery and Greenhouse Products. -The questions abomt nursory and greenhouse products related only to problucts eromm on the place for sale. Crops bought for resale without additional cultivation were to be excluded. The area used for growing and the value of sales were to be reported separitely for ench of three groups, as follows:
a. Nursery products, (trees, shrubs, vines, and ornamentals).
b. Cut flowers, potted plants, florist greens, and bedding plants. For these items, the area grown in the open was to be reported separately from the areagrown under glass.
c. Vegetables grown under glass, tlower seeils, vorgetahle seeds, vegetable plants, bulbs, and mushooms. For these items, the area grown in the onen was to be reborted separately from the area grown under glass or in the honse.
The data obtained for 1959 are comparable with those for 1954 and 1950 since the questions asked were esscntially the sane in the three censuses. Detailed data regarding the production and sale of nursery, greenhouse, and other horticultural products on farms having sales of $\$ 2,000$ will be published in volume $V$, part 1.

Forest Products.-The forest produrts data ohtained in the Census of Agriculture relate only to the products cut on farms. Conmercial logging, timber operations, and forest products grown or cut on nonfarm places are exchuded. Therefore, the data in this report do not represent the total furestry ontput or income for a county or State.

The questions inchuded on the 1959 agriculture questionnaire are more detailed than those asked in the 19 in Census, Value was obtained for the sale of standing timber or trees and for the sale of poles and piling, bark, bolts, and mine timbers. The quantity cut, whether for home use or sale, and the quantity sold were obtained for individual forestry products such as firewood and fuelwood, fence posts, sawlogs and reneer logs. Data relating to pulpwood, Christmas trees, maple trees, and maple syrup were obtained in states where such products are important commercially.

Value of Crops Harvested.-The total value af rrops harvested represents the estimated value of all crops larvested during the crop sear 1959 . It includes the value of quantities ennsuncd on farms as food, feed, seed, ete., as well as quantities sold. Farmers were not asked to repmrt values of crops harvested; the values were calculated in the Procossing othee. For individual crops, the quantity harvested was multiplied by the average price at which the erop was sold in the Statr. State arrage frices were furnished to the Bureau of the Census by the Agricultural Marketing Serviee of the U.S. Departnent of Agriculture. They are based on reports received from a sample of farmers and dealers. Quantitles harvested were not obtained for vegetables nor for nursery and greenhouse products. Therefore, for those crops, the value of sales, as obtained in the enumeration, was used in the calculation of total value of crops harrested.

Value of Crops Sold.-The questionnaire required value of sales of crops to be reported only for total regetables, nursery and greenbouse products, and certain forest products. For all other crops, the value of sales was calculated on a counts level during processing operations by multiplying the State average prices by either the quantity sold or the quantity harvested. Reports of quantity sold were obtained during the enumeration only for some of the major fleld erops. Quantity harvested was used in the calculation of value of crops sold for such crops as cotton, tobacco, etc., that are customarily grown for sale. The procedures used for the various crops are deseribed on page XXV. Thes
are similar to the frocedures followed in 10. 4 . In 1950 , ralues of cropss sull were obtained for eacli farm during the enumeration.

## Irrioation

Definltion of Irifgated Land.-Irrisited land is dxtintrl as land watered for agricultural purposes by artificial means. These means imbladed subirrigation as well as systems whereby water Was applied to the ground surface, either directly or by sprinklers. Land tlonded for rice eultivation was eonsidered as irrigated. Land fluoted during high-water periuds was to be included as irrigated only if water was direded to agrienbtural use by dams, canals, or other works. The definition of irrisated land specifically excluded land where the "Water table", or matural level of underground water, was controlled by drainage works with no additional water brought in by canals or pipes.

Enumeration of Irrigated Land.-A question on total land irrigated was asked in all States, with the exceltion of Alaska. The acreage reported for this question includes not only irrigated cropland but also ang other land that was irrigated in 1959.

The questionnaires used in the 17 Western States. Louisiana, and Hawaii included swएral additional questions requrding irrigation. These questions related to the aereage of land irrigated by sprinklers, irripated land from which erops were larvested, specific crops irrigated, and source of irrigution water. such additional data, for lrigated farms, are bresented in counts table la fur these sitates.

Statisties on the irrigation enterprises which supplied irrigation water were collected in the 1050 Census of Irrigation and are published in Volume III, "Irrigation of Agricultural Lands". This report coutains a considerable amount of data about irrigation for the 17 Western States and Louisiana.

Irrigated Farms.-All farms reporting ans land irrigated in 1959 are counted as irrigated farms.

Land In Irrigated Farms.-Data for land in irrigated farms according to use relate to the entire acreage in these farms, including land that was not irrigated.

Land Irrigated.-Data for land irrigated relate onls to that part of the land in irrigated farms that was watered by artificial means at any time in 10m. Spparate figures are given for farms reporting land irrigated by sprinklers whether or not the land was also irrigated bs other means. Additional tigures are given for farms reporting land irrigated by surinklers only. Data on sprinkler irrigation were not obtained in the 1954 census.

Irrigated Cropland Harvested.-The data for irrisated cropland harvested relate to all irrigated land from which crops were harvested in 1959, regardless of the method of irligation. An instruction on the questionnaire reminded enmmerators and respondents to include irrigated land from which hay was cut, irrigated land in both bearing and nonbearing fruit and nut crops, and irrigated land from which volunteer crops were harvested. Each irrigated acre was to he reported onls once, regardless of how many crops were harvested from it.

Other Irrigated Land.-This classification was obtained by subtraction of the acreage of irrigated cropland harvested from the aereage of total land irrigated. It represents primarily irrigated cropland not harvested and irrigated pasture or grazing land.
Farms Irrigated By Number of Acres Irrigated. All farms on which any land was irrigated in 1950 are classified according to the number of aces irrigated in counts table 1 a for the 17 Western States, Louisinna, and Hawaii. This elassification is based on total land irrigated. Therefore, it includes not onls the irrigated land from which erops were harvested but also all other irrigated land, rearardess of use.

Land Irrigated By Source of Water.-The agriculture questionnaire contained a question as to what proportion of irrigated water used on the farm in 1959 was obtained from groundwater, surface-water, and irrigation-organization sulurces. Respondents were asked to report separately the percentage of
water obtained from each source. The number of acres that were irrigated by water from each source or combination of sources was calcutated during office processing operations by applying the percentages to the total land irrigated.

Ground-water sources relate to wells (pumped or flowing) and springs; surface-water sources relate to streams, lakes, reservoirs, and sewage and drainage ditches. For eacl of these sources, only water obtained by pumps or other works operated as pact of the operator's own farm or as part of another simgle farm was to be included. Irrigation-organization sources relate to irrigation enterprises organized to supply water to a group of farms, regardless of how or where the enterprise ohtained the water. The irrigation enterprise may be a legat organization or a group of farmers informally organized to operate a supply ditch or other works to provide water for their own farms.

## Land-Use Practices

Summary Information.-The 1959 data for tand-use practices are estimates based on reports obtained from only a sample of farnis. Comparabte data are not presented for 1954 because questions about land-use practices were included on the 1904 questionnaire for only a limited number of States. The various land-use practices retate to methods for reducing soil erosion, either by improving the soil, controlling the run-off of water, or reducing the blowing of totsoit.

Cropland in Cover Crops.-The data retate to land on which cover crops were turned under for green manure in 1959 and which was then planted to another crop. The entire acreage of cover cropts so used was to be reported even if the foltowing crop failed.

Cropland Used for Grain or Row Crops Farmed on the Contour.-This item relates to land on which grain or row crops were planted in level rows around the slope of a hill.

Land in Strip-Cropping Systems for Soil-Erosion Control-Stripcropping was defined as the practice of alternating close-sown crops with strips or bands of row crops or of afternating either close-sown or row crops with bands of cultivated fallow land. The published data refer to the total acreage of all fields and tracts in which strip-cropping was practiced in 1959.

System of Terraces on Crop and Pasture Land.-This item relates to the acreage in ridge-type or channel-type terraces constructed on stoping cropland and pastureland.

## Livestock and Poultry

Inventories.-Data for livestock and poultry on farms relate to the number on hand at the time of enumeration. All livestock and poultry, including those being kept or fed under contract, were to be enumerated on the farm or ranch where they were, regardless of who owned them. Livestock in transit from one grazing area to another or grazing in national forests, grazlng districts, open range, or on land used under permit were to be reported as being on the place where the person who had control over them had his headquarters.

The time of year at which livestock and pouttry are enumerated affects the data. Therefore, the date of enumeration needs to be considered when totals for the various censuses are compared. Both the 1950 and the 1954 census data represent fall inventories. These censuses came at a time of large-scate movement of flocks and herds from one range to another, from ranch to feed lot, and from farm or ranch to narket.

The censuses of $1920,1925,1935$, and 1945 were taken as of January 1 and those of 1930, 1940, and 1950, as of April 1. A count made in Aprit varies considerably from one made in January. In most areas a large number of animals are born betwcen January and Aprit. A considerabie number of older animals dic or are sold during the same perlod. In the range States, along
with the change in season and grazing condition, sheep and cattle are moved from one locality or county to a nother. This movement may affect the comparability of data for counties and, in some cases, fur States. The comparality of data by age has been affected also by changes in the questions from one census to another.

Milk Cows, Cows Milked, Milk Produced, and Butter.-Data on the number of milk cows, cows milkel, and milked produced relate to the day preceling the enumeration. Data for butter churned were obtained only for 14 States and relate to the calendar week preceding the enumeration. The data for corvs milked yesterday and milk produced yesterday are not given in this volume. These figures were obtained primarily to serve the needs of the U.S. Department of Agriculture in making monthly and annual estimates of milk production. These figures can be made available, at a small cost, to others who extress an interest in them.

Whole Milk and Cream Sold.-Data for whole milk and cream sotd relate to the entire year 1959 and are estimates based on reports obtained for farms in the sample. All milk and cream sold from the farm (except quantities purchased from some other ptace and then resold) were to be included, regardless of who shared the receipts. The questionnaire provided three alternative units of measure for reporting the quantity of milk sotd-pounds of mitk, gallons of milk, and pounds of butterfat. The respondent was thus permitted to report quantity according to the unit of measure in which payment was received. In the State and county tables, the data for milk are given in the unit of measure most commonty used in the State. Pounds of butterfat were converted into gatlons or pounds of whole milk on the basis of the arcrage butterfat content of mitk as shown by data furnished by the Agricultural Marketing Service of the U.S. Department of Agriculture.

Sows and Gitts Farrowing.-In the 1959 census, data were obtained for the number of litters farrowed between December 1 , 1958, and June 1, 1959, and from June 1 to December 1, 1959. In the 1954 census, data were obtained for the sows and gilts that farrowed rather than for the number of litters.

Sheep, Lambs, and Wool.-In the 1959 census, questions about sheep, lambs, and wool were asked in all States. Data on shearings and on amount of wool shorn were obtained for lambs and sheep separately. In the 1954 census, sheep and lamb inventories were not obtained for Florida, Georgia, and South Carolina.

Goats and Mohalr.-In 1959, questions on goats, kids, and mohair appeared on the questionnaires for the following aine States: Arizona, California, Missouri, Nevadi, New Mexico, Oklahoma, Oregon, Texas, and Utah. In 1954, corresponding data were obtained for Louisiana, New Mexico, Oklahoma, Oregon, Texas, Washington, and selected counties In Missouri.

Bees and Honey.-No questions on bees and honey were included on the questionnaires for either the 1959 or the 1954 census. In 1959 , however, enumerators were instructed to obtain agriculture questionnalres for places not havlng agricultural operations if they were engaged in beekeeping. The number of hives of bees and the amount of honey sold were to be reported in the "Remarks" space of the questionnaire. Data for bees and honey are not included in this report.

Valne of Llvestock on Farms.-To obtain the value of livestock on farms, the number of each class of tivestock or poultry on hand was multiplied by the State average price for 1959 , as furnished by the Agricultural Marketing Service of the U.S. Department of Agriculture. Comparable data for 1954 were compited by the same method on the basis of a verage prices for that year.

Sales of live Animals.- Data for the number and value of anlmals sold ative ln 1959 are estimates based on reports for sample farms only. Corresponding data for 1954 were obtained for all farms. The dollar value of sales was obtained from the farmer
for cattle, calves, and horses and mules. Average value per head for other livestock sold was obtained from the T.S. Department of Agriculture. In the 1959 census, respondents were asked to report separately the number of live animals already sold and the number estimated to be sold between the time of ennmeration and the end of the year. This separation of reports for the number sold and to be sold was designed to assure more complete coverage of all livestock sales made during the year. In the 1954 census, only totals for the entire year were ohtained though reference was made to animals to be sold between emmeration and the end of the year.

Sales of Poultry and Poultry Products.-For both the 1959 and the 1954 Censuses, sales of chickens were obtained for two groups: (1) broilers and (2) other chickens. The enumeration of broiler sales presents probems arising from the varied contractual arrangements under which broilers are protuced. The questionnaire contained an instruction to the effect that all broilers grown for others under contract were to be reprorted as sold. During office processing operations, the data reported for inventories and sates of chickens four months ofd and over, chicken eggs sold, and broilers sold were carefully examined. Obvious inconsistencies indicating confusion between broilers and other chickens were corrected on the basis of estimated values and, for sample farms, on the basis of data reported for expenditures for feed, poultry and livestock purchases, hired labor, etc.
Questions relating to poultry other than chickens (and broilers) were generally the same in 1959 as in $\mathbf{1 9 5 4}$. In the $\mathbf{1 9 5 !}$ census, however, only total numbers were obtained for turkeys and turkey fryers ralsed and for turkey hens kept for breediug whereas the 1954 questionnaire asked for a breakdown between light and heavy breeds. Also, for poultry other than chickens and turkeys, the 1959 census obtained the number sold whereas the 1054 census obtained the number raised.

## Clasgification of Faims

Scope of Classification.-Data for land in farms, and for cropland barvested in farms classified by size, by color of operator and by tenure of operator were tabulated for all farars. However, most of the detailed data by size of farm, by color of operator, by tenure of operator, by economic class, and by type of farm are estlmates based on farms in the sample. The farm classifications by size of farm, color of operator, tenure of operator, economic class of farm, and the of farm were made in the processing office on the basis of data reported on each questionnaire.
Farms by Size.-Farms were classified by size according to the total land area established for each farm. The same classification was used for all States. According to definition, a farm is essentially an operating unit, not an ownership tract. All land operated by one person or partnership represents one farm. In the case of a landlord who has assigned land to cropers or other tenants, the land assigned to each cropper or tenant is considered a separate farm even though the landlord may operate the entire landholding as one unit in respect to supervision, equipment, rotatlon practice, purchase of supplies, or sale of products. In some parts of the South, a special Landlord-Tenant Questionnalre was used to assure an accurate enumeration of each unit within a multiple-unit operation. A change was made in the size classification for 1959, as contrasted with several preceding years, by subdividing the 1,000 -acre-and-over group and by combining two previously recognized groups, viz., 10 to 29 acres and 30 to 49 acres.

Farms by Color of Operator.-Farms were classified by color of operator into two groups, "white" and "nonwhite." "Nonwhite" Includes primarily Negro and Indian operators but also some of other racial origin.

Enumerators were instructed to report the race on the basis of thelr own observation whenever possible rather than by asking the respondent.

Farms by Tenure of Operator.-The classification of farms by temme of operator was based on data reported for land owned, land rented from others or worked for others on shares, land managed for others, and land rented to others or worked on shares lly others. The same basis of classification was used in 1959 as in 1904 .

For 195, each questionnaire was coled. during the editing proc. ess, to indicate whether it represented a farm operated by a full owner, part owner, manager, or tenant. The sample questionmaires for temats were given a code to indicate the kind of ten:int.
The various classifications of tenure, as ased for the $\mathbf{1 9 . 0}$ census, are defined helow:
a. Full 0 wners operate only land they own.
b. Part Owners operate land they own and also land rented from others.
c. Managers operate land for others and are paid a wage or salary for their services. Tersons acting merely as caretakers or hired as laborers are not classified as managers. If a farm operator managed tand for others and atso operated land on his own acecount, the land operated on his own account was considered as one farm and the land managed for others as a second farm. If, lowever, he manased land for two or more employers, all the managed land was considered to he one farm.
d. Tenants rent from others or work on shares for others all the land they operate. They are further classified, as described below, on the basis of rental arrangements in regard to the payment of cash rent, sharing of crops, sharing of livestock or livestock products, and the furnishing of work power bs the landlord.
(1) Cash Tenants pay cash rent, either on a per-acre basis or for the farm as a whole.
(2) Share-Cash Tenants pay part of the rent in cash and part ill a share of the crops and/or of the Jivestock and livestock products.
(3) Crop-Share Tenants pay a share of the crops but not of the livestock or livestock products.
(4) Livestock-Share Tenants pay a share of the livestock or livestock products. They may or may not also pay a share of the crops.
(5) Croppers are tenants whose landlords furnished all the work animats or tractor power. They usually work under the close supervision of the landowners or their agents, or other farm operators. Also, the land assigned to them is often merely a part of a multi-unit operation. Croppers may or may not also pay cash rent or a share of crops, livestock, or livestock products. Data for croppers are available for only 16 southern States and Missouri.
(6) Other Tenants are those who did not gualify for inctusion in any of the foregoing subclassifications. They may have had the use of land rent-free or in return for a fixed quantity of products, payment of taxes, maintenance of bulldings, etc.
(7) Unspecifled Tenants are those for whom the rental arrangement was not reported.
The defluition of each subclass of tenant was essentially the same for earlier censuses as for 1959. In 1945, however, the enumerator was asked to determine the subclass of tenants whereas in other censuses all classifications were made during the processing of questionnaires on the basis of the data reported. The procedure used in 1945 may have affected the comparablity of the data, especially for cash tenants and share-cash tenants.
Farms by Economic Class.-The totals for Parms by eronomic class are estimates for all farms made on the basis of data reported only for the sample farms. The economic classifications represent groupings of farms that are similar in characteristics and size of operation. The cconomic classes were estallished on the basis of one or more of four factors: (1) total value of all farm products sold, (2) number of days the farm operator worked off the farm, (3) the age of the farm operator, and (4) the relatlonship of income received by the operator and members of his bousebold from nonfarm sources to the value of all farm products sold. Institutional farms, Indian reservations, agricultural experiment stations, and grazing assoclations were always classified as "abnormal."

The total valne of farm products sold was obtained by addition of the reported or estimated values for all products sold from the farm. The calne of cattle and calves, horses and mules, dairy products, some poultrs products, vegetables, nursery and greenhouse products, standing timber, and miscellaneous forest prodnets was obtained from the farm operator during the enmmeration. The quantity sold was obtained during enumeration for corn, sorghums, small grains, hay, small fruits, some of the forest produets, ehickens and chicken eggs, hogs, sheep, and goats. To obtain the value of sales of these products, the quantity sold was multiplied by State average prices.

For each of the other products, the entire production was multiplied hy the state average price. If the restiling value amounted to $\$ 100$ or more, the entire quantity produced was considered as sold. This procedure was followed only in establishing the economic class and the type of farm but was not used in establishing the total value of products sold from the farm. (See p. XXV .)

Farms were grouped into two major categories, commercial farms and other farms, mainly on the basis of total value of prodnets sold. The 1050 class intervals and some of the criteria for determination of a wiven class are different from those used in 1454 and in 1950 . In general, for 1959 , all farms with a value of sales amounting to $\$ 2,500$ or more were classiffed as commercial. Farms with a rahe of sales of $\$ 50$ to $\$ 2,490$ were classified as commereial if the farm operator was under 65 yoars of age and (1) he did not work off the farm 100 or more days during the gear and (2) the income received by the operator and members of his family from nonfarm sources was less than the value of all farm products sold. The remaining farms with a value of sales of $\$ 50$ to $\$ 2,499$ and institutional farms and Indian reservations were inchuded in one of the grouns of "other farms."

Commercial farms were divided into six economic classes on the basis of the total value of all farm products sold, as follows :

|  | Value of Farm |  |  |
| :---: | :---: | :---: | :---: |
| Class of Fcrm | Prod | ucts | sold |
| I | \$40,000 | and | orer |
| II | \$20,000 | to | \$39,993 |
| 111 | \$10,000 | to | \$19,999 |
| IV | \$5,000 | to | \$0,999 |
| V | \$2,500 | to | \$4,909 |
| VI* | \$50 | to | \$2,499 |

- Provided the farm operator was under 65 years of age, and-
(1) he did not work off the farm 100 or more days, and (2) the income that he and members of his household received from nonfarm sources was less than the total value of farm products soid.

Other farms were divided into three economic classes as follows :
a. Class VII, Part-time.-Farms with a value of sales of farm products of $\$ 50$ to $\$ 2,499$ were classified as "part-time" if the operator was under 65 years of age and he either worked off the farm 100 or more dars or the income be and members of his household received from nonfarm sources was greater than the total value of farm products sold.
b. Class VIII, Part-retirement.-Farms with a value of sales of farm prodncts of $\$ 50$ to $\$ 2,499$ were classified as "partretirement" if the farm operator was 65 years old or over. Many of these are farms on which the income from nonfarm sources was greater than the valne of sales of agricultural products. Others are residential, subsistence, or marginal farmas. In previous censuses, the age of the farm operator was not a criterion for grouping farms by economic class. Since the number of elderly people in our population has heen steadily increasing during recent years, a separate classification for farms operated on a part-retirement basis was considered important for an adequate analysis of the agricultural structure of a county or State.
c. Class IX, Abnormal.-All institutional farms and Indian reservations were classified as "abnormal," regardless of the value of sales, Institntional farms include those operated
by hospitals, penitentiaries, schools, grazing assoclations, government agencies, etc.
Farms by Type.-The data for farms hy tspe are estimates based on data fabulated for the farms in the sample. The type represents a description of the major source of ineome from farm sales. To be classified as a particular type, a farm had to have sates of a partiontar trouluct or group of products amometing in value to $\mathbf{2 0}$ pereent or more of the total value of all farm products sold during the gear.

The types of farms, together with the products on which type classification is based, are as follows:

| Type of Farm | Source of Cash Income |
| :---: | :---: |
|  | (Products witl sales ralue representing $50 \%$ or more of total value of all farm products sold) |
| Cash-grain | Corn, sorghums, small grains, soybeans for beans, cowpeas for peas, dry field and seed beans and peas. |
| Tobacco | Tobacco. |
| Cotton | Cotton. |
| Oth | Peanuts, potatoes (Irish and sweet), sugarcane for sugar or sirup, sweet sorghums for sirup, broomeorn, popcorn, sugar beets, mint, hojs, and sugar beet seed. |
| Vegetable | Vegetables. |
| Fruit-and-nut | Berries, other small fruits, tree fruits, grapes, and muts. |
| Ponltry | Chickens, chicken eggs, turkeys, and other poultry products. |
| Dairy | Milk and cream. The criterion of 50 percent of total sales was modified in the case of dairy farms. A farm having value of sules of dairy prodncts amounting to less than 50 percent of the total rame of farm products sold was classified as a dairy farm, if- |
|  | (a) Milk and cream sold accounted for more than 30 percent of the total value of products sold and- <br> (b) Milk cows rejresented 50 percent or more of total cows and- |
|  | (c) The value of milk and cream sold plus the value of cattle and calves sold amomnted to 50 percent or more of the total value of all farm products sold. |

Livestock other than dairy and poultry. $\qquad$ Cattle, calres, hogs, sheep, goats, wool and mohair except for farms in the 17 Western States, Loulsiana, and Florida that qualified as livestock ranches.
Livestock Ranches_.... Farms in the 17 Western States, Louistana, and Florida were classified as livestock ranches if the sales of livestock, wool, and mohair represented 50 percent or more of the total value of farm products sold and lf pastureland or grazing land amounted to 100 or more acres and was 10 or more times the aereage of cropland harrested.
General
Field seed crops, hay, silage. A farm was classified as general also if it had cash income from three or more sources and did not meet the criteria for any other type.
Miscellaneous_-_-..... Nursery and greenhouse products, forest products, mules, horses, colts and ponies. Also all institutional farms and Indian reservations.

The tyine classifieations were essentially the same for the 1959 as for the 1004 census except that tobacor farms and livestork randhes were not setarately dassified in 1924 . Tobaceo was indhuded as one of the rrops used in the dassification of "other field (rop" farms in lont. The farms classified as livestock randers in 19.5 would have been classified as "livestork other than dairs and poultry in lant withont regard to the acreage in bisture.

Value of Farm Products Sold.-l bita for the value of farm prod-
 ucts and bev extimation for others. Thu questionmaire nsed for the 1 arba census provided for falm uphrators to report value of sales fur the following products:
Yegetables Misomberous pouttry products
Nursers and greenhouse prodnets Milk and eream
Cattle
Standing timber
(alres
Miscellaneous forest products lorses, mules, colts, and ponies
For all other agrionltural broducts, the value of sales was estimated during the oftie processing. The state average prices used for caldulating the value of farm brodncts sold were furnished to the lumeati by the Agricultural darketing Service of the lis. Department of Agricalture. One of three following proredures was used.
(1) For the products for which data un quantities sold were obtainod during emmeration, the state arpage priaes were multiplied by the comty totals of the quantities reported as sold or the duantities remorted as produced for sale. That following prodwats weracovered by this procedure:

| Corn for grain | Fencep prsts |
| :---: | :---: |
| Sorghums for 1 rain, seed, sirup, or dry furage | Nawlogs and veneer logs christmas trees |
| All small grains | Chiscrens (bruilers and others) |
| Hay erops | Chicken eggs |
| All berries and small fruits ${ }^{1}$ | Hogs and pigs |
| Firewood and fuelwood | Sheep and lambs |
| 1'nlpwood | Goats and kids |
| ${ }^{1}$ Adjustment made for cranbe Program. | es based on Cranberry Payment | Program.

(2) For most of the agricultural products which are custounarily raised for sale, the entire quantity produced was considered to be sold. The State arerage priess were, accorningly, multiplied by the comits total of production. The following erops were covered by this procedure:

Cotton
lopeorn
Sugar beets for sugar Broomeorn

Sugarcane for sugar Tobacco
Wool
Mohalr
(3) For all other crops, the State average prices were multiplied by the quantities sold as estimated on the basis of crop)disposition data furnished by the Agricultural Marketing service, data rephrted in questions for "other crons" on the 195." questionnaire, or data ohtained from earlier censuses.

For all tree fruits, muts, and grapes, the entire quantity produced was consitherd as sold, exrept for atples, apricots, sour and sweut cherries, puaches, phoms, puunes, avoeados, tangerines, wamses, and grapufruit in states where a portion of the crop Was not harvesid or wias subjected to exeess cullage as indieated by data obtained form the Agricultural Marketing Service of the U.S. Departmont of Adriculture.

The data for loge are comprable with those for 1954 since essentially the same procedures were used in both censuses for estimating quantities and values of farm products sold. In 1959, as in 19\%4, data for the sales of farm products represent total sales for the entire farm, regardless of who shared the reeeipts. For tenant-operated farms, the landlord's share of agrirultural products was considered as sold provided the products wore moved off the tenant farm. All crops, livestock, aud poultry raised under a confract arrangement were considered as sold from the farm where they were raised. For institutional farms, all agricultural items produced on land operated by the institutimn and consmmed bs the immates were to be reported as sold.

All sales data relate to one year's farm operations. Cropsales are for crops harvested during the erop year, whether the crols ware actaally sold immediately after harvest or placed in storage for later sale. Saltss of livestock and livestock products relate to the calemdar gear, regardless of when the livestock or products were raised or produced. All wool and mohair reported as shorn or clipped was considered as sold.

Enumerators were instructed to record gross values of quantities sold, with no deductions for feed, seed, fertilizer, water, labor, or marketing costs. For some products, however, net values may have been reported. In the case of milk, particularly, some farm operators may have reported the payments they received as the gross value of sales, even though the buyer had dedueted handling and hauling charges before making payment. Adjustments were made in the data reborted only in cases of obvious error.

NA Not avaliable
${ }^{{ }^{2} \text { For }}$ the Censuses of 1959 and 1954, in the Cenous year; for all other Censuses, in the calendar year preceding the Census.
${ }^{2}$ Total acreage of crops for which flgures are avallable, except that com cut for forage was excluded as most of this gereage was probably duplicated in the acreage of corn aryested for grain
4irnety comparable for the various Census years because of differences in definition of cropland used only for pasture. See text.
${ }_{5}$ Irrigated croplard only.
${ }^{\text {In }}$ Includes irrigated cropland not harvested and not psstured.

State Table 2.-FARMS AND FARM ACREAGE ACCORDING TO USE, BY SIZE OF FARM: CENSUSES OF 1920 TO 1959
Data for 1959 and 1950 are based on repants for only a sample of famms, siee text]

[^71]

[^72]State Table 3.-FARMS AND FARM ACREAGE, BY COLOR AND TENURE OF OPERATOR: CENSUSES OF 1920 TO 1959

 acreage of corn harvested for grain.

# State Table 4.-FARM OPERATORS BY COLOR, AGE, RESIDENCE, AND OFF-FARM WORK; AND EQUIPMENT AND FACILITIES ON FARMS: CENSUSES OF 1920 TO 1959 

NA Not available.
${ }^{1}{ }^{2}$ Figures for 1945 are for a 11 tractors.
${ }_{3}^{2}$ Concrete, brick, asphalt, and macadam.
${ }^{3}$ Concrete or brick and macadam. Asphalt was not included.
Sincludes sand-cley.
${ }^{5}$ Gravel.
${ }^{6}$ D1stance to all-weather road. See text.

[^79]${ }^{2}$ Total acreage of crops for which figures are avallable, except that corn cut for forage was excluded qs most of this acreage was probably duplicated in the acreage of corn harvested for grain
${ }^{3}$ value of corn and other corn products sold.
Inciudes corn cut for shlage
corn cut for forage
${ }^{6}$ Sorghums for all purposes, except for sirup.
TValue or sorghuns sold for hay or forage included in value of sorghuns sold for grain or seed.
${ }^{8}$ Sugarcene or sorghurs for slrup not reported separately.
The 194 and 1939 figures do not include acres plowed under for green manure
${ }^{10}$ See compeas cut for hay.
12 For figures on annual legunes saved for hay, including soybeans and cowpeas, see pearut vines or tops saved for hay or forage.
${ }^{12}$ Includes fams reporting cowpeas harvested for green pres only.
${ }_{12}{ }^{13}$ Soybeans and compeas cut for hay.
25 calculated value of peanuts hariested for nuts, peanuts harvested for hay, and peanuts hogged or grazed.
${ }^{15}$ Reported in bushels.
${ }^{16}$ Prior to 1944, ennual legunes saved for hay, but excluding vetches in 1924
${ }_{18}^{17}$ For all Censuses except 1950, obtained by adding the Indivtaual hay crops.
${ }_{19}{ }^{\text {Inciudes oats cut for feeding unthreshed. }}$
20 Silage crops other than corn and sorghums.
2liciover seed. except sweptclover.
22 Wover sead, inchuarg suentchover
${ }^{22}$ Value of 11 int cotton only.
${ }^{23}$ For 2959 and 1954, does not inciud agrege for farms with less than 20 bushels harvested; for 1949, does not inciud acreage for farms with 2 ess than 15 bushels harvested. See 24 text.
${ }^{24}$ Sugarcene for ail purposes
${ }^{25}$ Includes receipts fram sale of pasture and grazing privileges and the value of cowpeas harvested for green peas.
${ }^{26}$ Excludes Irish potatoes and sweetpotatoes, except for 1920 Census which included potatoes for hane ue only.
${ }^{27}$ Excludes Irish and sweet potatoes.
${ }^{28}$ Doos not include fams reporting green cowpeas only.
${ }_{30}^{24}$ Does not include the value of green cowpess sold. Sep footnote 25 .
${ }_{31}^{30}$ Green 1 ima beans included with snap beans.
${ }_{32 \text { Inciudes }}^{32}$ peppers and pimientos included with sweot peppers.
${ }^{33}$ Inc iudes pimientos.
${ }^{33}$ For Censuses prior to 1950, small frults harvested for hame use or for sale.
${ }^{34}$ For 1959 and 1954, do s not include data for farms with less than 20 trees and grapevine. See text,
${ }^{35}$ Does not include acreage for fams reportine less than $1 / 2$ asre. Sus text.
${ }_{37}^{36}$ Boxes, kind not apecifled.
${ }^{37}$ Reported in arates.
39 Reported in bunches.
${ }^{39}$ Reported by number of coconuts.
 1945, harvested in 1943-ivi from the bloam of 1943; for 1940, harvested in 1930 -in from the bloom of $203{ }^{\circ}$.

State Table 18.-FARMS AND FARM CHARACTERISTICS OF COMMERCIAL FARMS BY TYPE OF FARM BY ECONOMIC CLASS OF FARM: CENSUS OF 1959-Continued
Part 7 of 9.-Livestock farms other than poultry and dairy farms

Z Reported in small fractions.
${ }^{1}$ Includes milk equivalent of cream and butterfat sold.
${ }^{2}$ Does not include acreage for farms with less than 20 bushels harvested.
${ }^{3}$ Does not include data for farms aith less than 20 trees and grapevines.

Part 8 of 9.-Livestock ranches

Dista are hased on reprit - for onty a sample of farma. See text」] Fconomic flaye

[^0]:    "The Secretary shall, beginning in the month of October 1959, and in the same month of every fifth year thereafter, take a census of agricultare, provided that the censuses directed to be taken in October 1059 and each tenth year thereafter, may. when and where deemed adrisable hy the Secretary, be taken instead in conjumetion with the censuses provided in section 141 of this title." (Section 141 relates to the decennial censuses of population, unemplosment, and housing to be taken as of the first day of April of each decennial year.) Under authority granted by Section 4 of Title 13 , the Secretary of Commerce delegated "the functions and duties imposed upon him by this title" to the Director of the Bureau of the Census.

    Pretest of the 1959 Census.-A "pretest" of the field procedures of the 1959 Census of Agriculture was conducted in 17 counties of the United States during the fall of 1958 . The purpose of the pretest was to provide the Bureau with a measure of the effectiveness of the questions and procedures planned for the 1959 nationwide census. Thrce versions of the agriculture questionnaire - the first one for Northern States, the second for Southern States, and the third for Western States-were used in the pretest. Each version contained questions appropriate to the type of agriculture in the part of the country where it was used. All major aspects of field forms and procedures, from the hiring and training of crew leaders and enumerators to actual interviews with farm operators, were given a "trial run" in each of the 17 counties. Preliminary versions of reporting forms, maps, payroll records, training guides, and instruction manuals were subjected to actual use under conditions simulating those expected in the nationwide enumeration conducted in the fall of 1959.

    In making final preparations for the 1959 census, the staff of the Bureau drew heavily on the results of the pretest, as well as on experience gained from previous censuses.

    Training Program for Personnel for Enumeration.-Every person hired to do work in connection with the 1959 Census of Agriculture received specialized training for his job. Staff mem-
